## DDS concepts

This topic provides an overview of data description specifications (DDS) on iSeries™ servers.

A traditional means of describing data attributes (such as the names and lengths of records and fields) is to specify the data attributes in the application programs themselves. However, a convenient and powerful alternative is available on iSeries servers. Data description specifications (DDS) describe data attributes in file descriptions that are external to the application program that processes the data.

The file types that use DDS are physical and logical files, display files, printer files, and intersystem communications function (ICF) files.

**Note:** By using the code examples, you agree to the terms of the “Code license and disclaimer information” on page 45.

## Printable PDF

Use this to view and print a PDF of this information.

To view or download the PDF version of this document, select DDS concepts (about 1170 KB).

## Other information

You can view or download these related topics:

- DDS for physical and logical files  (about 1184 KB) contains reference information for using DDS with physical and logical files.
- DDS for display files  (about 3413 KB) contains reference information for using DDS with display files.
- DDS for print files  (about 1861 KB) contains reference information for using DDS with printer files.
- DDS for ICF files  (about 526 KB) contains reference information for using DDS with ICF files.

## Saving PDF files

To save a PDF on your workstation for viewing or printing:

1. Right-click the PDF in your browser (right-click the link above).
2. Click the option that saves the PDF locally.
3. Navigate to the directory in which you want to save the PDF.
4. Click **Save**.

## Downloading Adobe Reader

You need Adobe Reader installed on your system to view or print these PDFs. You can download a free copy from the Adobe Web site ([www.adobe.com/products/acrobat/readstep.html](http://www.adobe.com/products/acrobat/readstep.html)) .

---

## Create a file using data description specifications (DDS)

Use these steps to create a file using DDS.

To create a file using DDS, follow these steps:

1. Complete the DDS form.
2. Type the source statements into a source file. The source file can be part of the i5/OS™ database (in a source physical file such as the IBM-supplied QDDSSRC in library QGPL) or it can be on diskettes.
3. Create the file using the appropriate CL command.

**Note:** Using the screen design aid (SDA) utility, you can create and test display files without coding DDS directly, using only the functions that apply to display files. See the *ADTS for AS/400®: Screen Design Aid* manual on the V5R1 Supplemental Manuals  Web site.

## Complete the DDS form

Use the data description specifications (DDS) form to enter positional and keyword information in the designated columns.

A sample DDS form is printed in reduced size in Figure 1 on page 3.

The left side of the DDS form (positions 1 through 44) is for fixed-format entries called *positional* entries. Positional entries define the most common attributes of record formats and fields, such as names and lengths of fields. For a brief description of the most important positional entries, see items 1 through 7 following the figure. For more detailed information about positional entries for each of the file types, see the following topics:

- Positional entries for physical and logical files
- Positional entries for display files
- Positional entries for printer files
- Positional entries for ICF files

The right side of the DDS form (positions 45 through 80) is for DDS *keywords*. DDS keywords define less-common and more-varied attributes of files, record formats, and fields; they follow a subset of the syntax rules for control language. For a brief description of keyword entries, see item 8 following the figure. For more detailed information about keyword entries for each of the file types, see the following topics:

- Keywords for physical and logical files
- Keywords for display files
- Keywords for printer files
- Keywords for ICF files

<sup>a</sup>Values are least squares means for 1992.

- 1 **Sequence Number** and **Form Type** are optional in DDS. The form type identifies the source as DDS source. The entries are valid for all types of files.
- 2 An asterisk in position 7 makes the entire line a comment. This is valid for all types of files. When A (And), or O (Or), or a blank is in position 7, positions 8 through 16 can provide conditioning for the DDS on or immediately following the current line. Conditioning is not valid in physical or logical files.
- 3 **Type of Name or Specification** (position 17) identifies the **Name** entry (positions 19 through 28) or the specification:

4 R specified in position 29 indicates that the attributes of the field in **Name** (positions 19 through 28) refer to a field specified elsewhere. This is ignored for logical files.

5 **Length, Data Type, and Decimal Positions** specify attributes of named fields within record formats. These are valid for all types of files.

6 **Usage** specifies fields as input, output, output/input, neither input nor output, hidden, message, or program-to-system fields. Each type of file has its own restrictions regarding field use.

- 7 **Location** specifies the location of the field on the display or printed page. This applies for display and printer files only.
- 8 **Functions** specified through the use of keywords apply at different levels for different file types, as follows:

**Keywords apply at this level**

File  
Record  
Field  
Join  
Key field  
Select or omit field  
Help

**For these files**

All types of files  
All types of files  
All types of files  
Join logical files only  
Physical and logical files  
Logical files only  
Display files only

For display and printer files, constants specified within single quotation marks become the default values for displayed or printed fields.

## Enter the DDS source statements

After filling out the forms, enter the source statements into source files.

You can enter the source either interactively or in batch.

### Enter source statements interactively with SEU

Use the source entry utility (SEU) of the WebSphere® Development Studio. See the *ADTS for AS/400:*

*Source Entry Utility* manual on the V5R1 Supplemental Manuals  Web site. Type in the Start SEU (STRSEU) command to call SEU.

### Enter source statements in batch using diskettes

Use one of the following methods:

- Enter an input stream containing DDS source and control language (CL) commands on diskette and start a spooling reader using the Start Diskette Reader (STRDKTRDR) command.
- Enter only source statements on diskette and copy the resulting data file into a source physical file with the Copy File (CPYF) command.
- Enter only source statements on diskette and type a CL command to create the file. Specify the name of the data file on the SRCFILE parameter and \*FILE on the SRCMBR parameter of the command.

**Note:** This method does not create a source physical file.

## Create the DDS file

Create the file by running a CL command that corresponds to the type of DDS file you are creating.

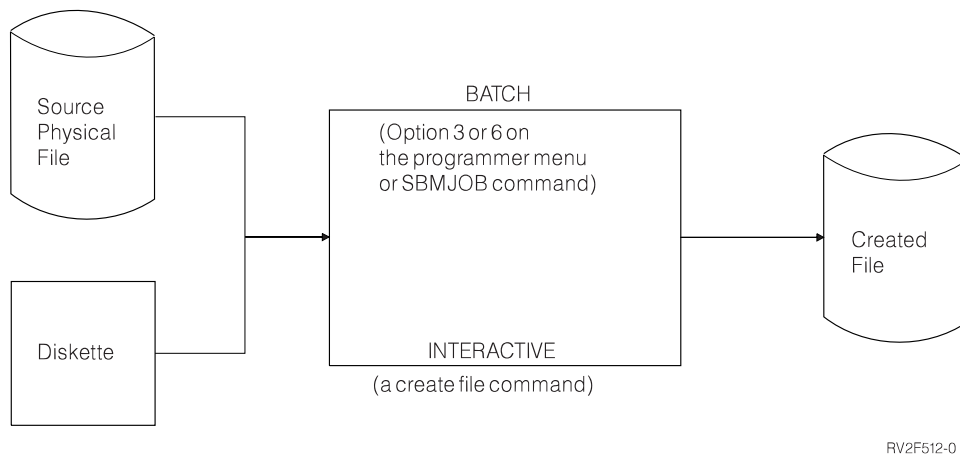

The file types and their corresponding commands are listed in the following table.

File type	Command
Physical file	CRTPF
Logical file	CRTLf
Display file	CRTDSPF
Printer file	CRTPRTF
ICF file	CRTICFF

When you issue a CL command to create a file, the DDS is retrieved from the source file and validated, and a file is created as shown in the following figure. The file is created only if there are no errors in the DDS of equal or greater severity than the severity specified on the GENLVL parameter of the CL command that creates the file. Thus, you can use the GENLVL parameter to control the allowable error severity when creating the file. Depending on the options you specify on the OPTION and FLAG parameters, a DDS source (or compiler) listing can also be created. The DDS listing contains the data description and error information.

You can use the FLAG parameter to specify the minimum severity of DDS messages which will be printed. For example, you can suppress the warning messages for field overlapping.

### Related concepts

“Example: DDS compiler listing” on page 39

This is an example of a DDS compiler computer printout.

“DDS debugging template” on page 41

A special template is available to help you in interpreting the fields on the DDS compiler computer printout.

## DDS coding rules, conventions, and terms

When you describe data attributes with DDS, you need to be aware of specific coding rules, naming conventions, and terminology.

### Conventions and terminology used in the DDS information

The DDS information uses specific phrases and terms to describe key concepts.

When you read the DDS information in the information center, be aware of the following conventions:

- A *keyword* is a name that identifies a function.
- A *parameter* is an argument shown between the parentheses on a keyword that identifies a value or set of values you can use to tailor the function the keyword specifies.
- A *value* is an actual value that you can use for a parameter.
- In the keyword descriptions, *this field* or *this record format* means the field or record format you are defining.
- The expression *use this file- or record-level keyword* means that the keyword is valid only at the file or record level.

- *To specify a keyword* means to code the keyword in the DDS for a file. This contrasts with *to select a keyword* or *when a keyword is in effect*, which both mean that any conditioning (such as one or more option indicators) is satisfied when an application program issues an input or output operation.
- *Current source* or *source you are defining* means the DDS that together make up the description of one file.
- In sample displays, character fields are shown as Xs and numeric fields are shown as Ns.
- The 5250 Work Station Feature is a feature of the OS/2® communications manager that allows the personal computer to perform like a 5250 display station and use functions of i5/OS.
- *Logical file* includes join logical files, simple logical files, and multiple-format logical files.
- *Page* means to move information up or down on the display. *Roll* means the same as page. *Paging keys* are the same as *roll keys*. The PAGEDOWN keyword is the same as the ROLLUP keyword. The PAGEUP keyword is the same as the ROLLDOWN keyword.
- Keyword descriptions use the following punctuation marks to indicate the syntax for the keyword:
  - () Enclosed values are required.
  - [] Enclosed values are optional.
  - [...] Specify additional values as needed.
  - { } The upper value is the default value.
  - | Specify either the value to the left or to the right (may refer to optional values).

## Rules for DDS keywords and parameter values

When you code DDS entries, follow these conventions for entering keywords and their parameters.

The DDS coding syntax for keywords and their parameter values is similar to the CL syntax. The DDS syntax rules are:

- Code all DDS entries in uppercase except for character values enclosed in single quotation marks and extended names enclosed in quotation marks.
- Code keywords on the same (or subsequent) line as the entry with which they are associated.
- Separate multiple keywords with at least one blank. Parameter values for keywords must be enclosed in parentheses. The initial parenthesis must immediately follow the keyword. For example:  
KEYWORD(VALUE)
- This rule is slightly different from that in control language. When coding control language, the parameter values can be positional. Syntax for DDS requires that the keyword be specified, except when specifying either a constant or the parameter value for the DFT (Default) keyword.
- Separate multiple parameter values for the same keyword with at least one blank. For example:  
KEYWORD(VALUEA VALUEB)
- A parameter expression consists of a set of values surrounded by left and right parentheses. Generally, the first value within the expression is a special value. The special value begins with an asterisk and must immediately follow the left parenthesis. One or more parameter values follow the special value. Separate the special value and the parameter value(s) by at least one blank. The last parameter value must immediately precede the right parenthesis. A parameter expression represents one parameter value and must be separated from other parameter values by at least one blank. For example:  
KEYWORD(VALUEA (\*special-value VALUEB) VALUEC)
- Use single quotation marks to enclose character values. Numeric values appear without single quotation marks. See the coding examples for COMP, RANGE, and VALUES keywords. Character values can appear in two places in the syntax:
  - As a parameter value for some keywords. For example, TEXT (all types of files) and COLHDG (database files) require character strings as text description. Other keywords, such as CAnn and CFnn, use character strings as text descriptions for response indicators.

- As the default value of a constant field (either with or without the DFT keyword) for display and printer files only. In display files, a character constant can also be specified for named fields. Even if you do not specify the DFT keyword, specifying a character constant implies the DFT keyword.
- To specify a single quotation mark within a character string, specify two single quotation marks so that one single quotation mark appears in the output. For example:

```
KEYWORD('Customer''s name')
```

appears as

```
Customer's name
```

- Use a plus (+) or a minus (–) sign as a continuation character when a keyword and its parameter values do not fit on a single line. The sign must be the last nonblank character in the functions field. A single statement can be continued for a maximum of 5000 character positions.
  - A **minus (–) sign** means that the continuation begins in position 45 of the next line (the first position in the functions field).
  - A **plus (+) sign** means that the continuation begins with the first nonblank (first significant) character in the functions field on the next line.

If you specify a continuation character within a parameter value, any blanks preceding the continuation character are included in the parameter value.

- Specify a plus (+) sign as the last nonblank character on a line to continue conditioning for keywords specified on the next line. This is helpful when a condition includes several option indicators and applies to several keywords.
- The operating system continues a DDS statement until you specify one of the following fields:
  - A record format name (R in position 17).
  - A field specification (field name or location).
  - For physical or logical files, a key field specification (K in position 17).
  - For logical files, a select or omit specification (S or O in position 17).
  - For join logical files, a join specification (J in position 17).
  - For display files, a help specification (H in position 17).
  - For device files, an option indicator or condition name that conditions a keyword, field, or field location.
  - The maximum length of a DDS statement (5000 characters). The fixed length entries (positions 1 through 44) of the first line are included in the statement, so the maximum space available for keywords is 4956.

## DDS naming conventions

DDS requires that files, records, fields, and other labels and identifiers that are described in DDS keywords should follow specific rules.

The naming conventions used in DDS are as follows:

- Qualified names
  - Use a slash to separate the parts of a qualified name. Embedded blanks are not allowed. For example:  
KEYWORD(library/file)
  - For most keywords with a qualified name parameter value, you can code \*LIBL or \*CURLIB for the library name. If you do not specify a library name, \*LIBL is used. You cannot code \*USRLIBL for the library name. This rule differs from that in CL, which often allows \*USRLIBL.
  - Code a maximum of 10 characters for object names. If you enclose the name in quotation marks, you may specify up to 8 characters between the quotation marks. This rule is different from that in CL, which allows a basic name of up to 10 characters to be specified between the quotation marks. Refer to the Control language (CL) topic collection for syntax rules for object names.
- Record and field names

- The DDS syntax rules for record and field names are:
  - Names must be 10 characters or less.
  - Names must begin with an alphabetic character (A through Z, @, \$, and #). All subsequent characters can be alphanumeric (A through Z, 0 through 9, @, \$, #, and \_ (underscore)). There can be no embedded blanks.
  - In ICF files, record names cannot start with \$\$.
- Specify qualified field names similar to qualified names. For example:  
`KEYWORD(record-name/field-name)`

High-level languages can impose specific length and value restrictions on the name. Check the appropriate high-level language reference guide for the syntax requirements for your high-level language processor.

- ALIAS (alternative field) names
  - The length of an alternative field name is 1 to 30 characters. The first character must be A through Z. Subsequent characters must be A through Z, 0 through 9, or the underscore (\_).
  - Because DDS does not perform any language-specific syntax checking, you must make sure that the alternative field names you specify conform to the naming conventions of the high-level language that uses the names. The high-level language compiler checks the syntax of the names when they are brought into the program.
- Message identifiers
  - Message identifiers must be 7 characters long. The first 3 characters are the message prefix.
  - The first character of the message prefix must be an alphabetic character (A through Z, @, \$, and #). The next 2 characters of the message prefix must be alphanumeric (A through Z, @, \$, #, \_, 0 through 9).
  - The last 4 characters must be a hexadecimal value (0 through 9, A through F).
- Label, document, and folder names
  - An online help information label name must be from 1 to 10 characters long and must begin with an uppercase alphabetic character (A through Z, @, #, or \$). The label name cannot contain a comma, a single quotation mark, or an embedded blank.
  - A document name (and a simple folder name) must be a 1 to 8 character part. It can be followed by a period and a 1 to 3 character part called an extender. The characters used most often are A through Z, 0 through 9, @, #, \$, and \_.
  - If a folder name is concatenated, each simple folder name is separated by a forward slash (/). The total length of the folder name cannot exceed 63 characters.
  - In DDS, a document, simple folder name, or online help information label name can be enclosed in single quotation marks. The enclosing single quotation marks are required when the name contains an opening or closing parenthesis or a single quotation mark character. When the name is enclosed in single quotation marks, specify two single quotation marks for each single quotation mark character within the name. If a folder name is concatenated, the enclosing single quotation marks, if specified, must be around the entire concatenated name.

## DDS keywords and parameters

DDS keywords and parameters typically consist of combinations of standard abbreviations.

All the keywords and parameters used in DDS are listed in alphabetical order as follows:

Abbreviation	Meaning
A	after
AB	allow blanks
ABS	absolute
ACC	access
ACCEL	accelerator

<b>Abbreviation</b>	<b>Meaning</b>
ALARM	alarm
ALT	alternative
ALW	allow
ARA	area
ATR	attributes
AUTO	automatic
AVAIL	available
B	before
BDY	boundary
BL	blinking field
BLANKS	blanks
BLINK	blinking cursor
BLK	blank
BOX	box
BTN	button
CA	command attention key
CCS	coded character set
CDE	code
CF	command function key
CHC	choice
CHG	change
CHK	check
CHR	character
CLR	clear
CLRL	clear line
CLS	class
CMD	command
CMP	comparison
CMT	commit
CNL	cancel
CNT	continued
CNV	conversion
COL	column
COMP	comparison
CON	constant
CONCAT	concatenate
CS	column separator
CSR	cursor
CTL	control
DAT	date
DEC	decimal
DEV	device
DFN	defined
DFR	defer
DFT	default
DLT	delete
DOC	document
DSP	display
DTA	data
DUP	duplicate
DWN	down
DYN	dynamic
EDT	edit
END	end

<b>Abbreviation</b>	<b>Meaning</b>
ENT	entry
EOS	end of session
EQ	equal
ER	end of record (same as end of field)
ERR	error
EXCLD	excluded
FAIL	fail
FCFO	first-changed first-out
FE	field exit
FIFO	first-in first-out
FIX	fixed
FLD	field
FLT	floating point
FMT	format
FNT	font
FRC	force
FULL	full
GDF	graphic data file
GE	greater than or equal to
GPH	graphics
GRD	grid
GRP	group
GT	greater than
HDG	heading
HI	high intensity
HLP	help
ID	identifier
IDX	index
IGC	double-byte character set (DBCS)
IND	indicator
INP	input
INZ	initialize
J	join
LC	lowercase
LCK	lock
LE	less than or equal to
LEN	length
LIFO	last in first out
LIN	line
LOC	location
LT	less than
LVL	level
MAP	map
MDT	modified data tag
ME	mandatory enter
MF	mandatory fill
MGT	management
MLT	multiple
MNU	menu
MOU	mouse
MSG	message
MSK	mask
M10	IBM® Modulus 10
M10F	IBM Modulus 10

<b>Abbreviation</b>	<b>Meaning</b>
M11	IBM Modulus 11
M11F	IBM Modulus 11
NBR	number
ND	nondisplay
NE	not equal to
NEG	negative
NG	not greater than
NL	not less than
NULL	null
NXT	next
OF	off
OID	operator identification
OUT	output
OVR	override
P	physical
PAG	page
PC	position cursor
PCN	precision
PFILE	physical file
PGM	program
PNL	panel
POS	position
PR	protect
PRG	progression
PRP	prepare
PRT	print or printer
PSH	push
PTH	path
Q	queue
QLTY	quality
RA	record advance
RAB	right-justify with blank fill
RAZ	right-justify with zero fill
RB	right-justify with blank fill
RCD	record
RCV	receive
RECID	record identification
REF	reference
REL	relative
RET	retain
REV	reverse
RI	reverse image
RL	right to left
RLTB	right to left, top to bottom
RMV	remove
RNA	record not active
ROL	roll
RQS	request
RRN	relative record number
RSP	response
RST	restore
RTN	return
RTT	rotate
RZ	right-justify with zero fill

Abbreviation	Meaning
SCH	search
SCROLL	scroll
SEL	select
SEG	segment
SEP	separator
SEQ	sequence
SFL	subfile
SHELF	shelf
SIZ	size
SKIPA	skip after
SKIPB	skip before
SLNO	starting line number
SLT	select
SNG	single
SP	select by light pen
SPACEA	space after
SPACEB	space before
SST	substring
STS	status
SW	switch
SYN	sync
SYS	system
TIM	time
TITLE	title
TNS	transaction
TRNRND	turn around
TRNTBL	translation table
TXT	text
TYP	type
UL	underline
UNAVAIL	unavailable
USR	user
VAL	values
VAR	variable
VLD	valid
VN	validate name
VNE	validate name extended
WDW	window
WRD	word
WRT	write

---

## General considerations for using DBCS text with DDS files

These topics describe the general considerations for positional entries, keyword entries, double-byte character set (DBCS) text literals, and DDS computer printouts that contain DBCS characters.

DBCS text can be encoded as either Unicode or EBCDIC. If you are working on a new application or enabling an existing application for DBCS text or working on an application involving Java™, ODBC, JDBC, or other web methods, then i5/OS Unicode support provides the easiest way to support not only DBCS text but also other text types. If you are working on an existing application already supporting DBCS text stored as EBCDIC, then i5/OS EBCDIC support for DBCS text is useful.

DDS uses the following terms to describe the different types of DBCS data:

**DBCS data**

A general term to describe any form of EBCDIC-encoded DBCS data.

**DBCS field**

A general term to describe any field that can contain EBCDIC-encoded DBCS data.

**Bracketed DBCS data**

EBCDIC-encoded DBCS data that begins with a shift-out character and ends with a shift-in character.

**DBCS graphic data**

EBCDIC-encoded DBCS data that contains only DBCS data and does not contain shift-out and shift-in characters.

**Unicode data**

A general term to describe any form of Unicode-encoded DBCS data.

**Unicode field**

When the graphic data type is used with CCSID 1200 specified, then Unicode (UTF-16) is stored in the field instead of EBCDIC. When character data type is used with CCSID 1208 specified, then Unicode (UTF-8) is stored in the field instead of EBCDIC.

**Related information**

DBCS considerations for database files

DBCS considerations for display files

DBCS considerations for printer files

DBCS considerations for ICF files

## Positional entries for files that use DBCS data

Positional entries are adapted so that you can define data fields that contain DBCS data. The entries are adapted for the length and data type positional entries.

DBCS data is either *bracketed* or *graphic*. Bracketed-DBCS data begins with a shift-out character and ends with a shift-in character. DBCS-graphic data contains only DBCS data and does not contain shift-out and shift-in characters. The term DBCS refers to both bracketed and graphic DBCS data.

### Length (positions 30 through 34)

Consider these effects when determining the length of a DBCS field.

For bracketed-DBCS fields:

- Positions occupied by double-byte characters as compared to the positions occupied by alphanumeric characters
- Shift-control characters
- Keyboard shift (if any)

For graphic-DBCS fields:

- Length is specified as the number of DBCS characters with no shift-control characters

### Data type (position 35)

Use these DBCS data types to identify DBCS fields.

For bracketed DBCS fields:

**J (Only)**

Fields can contain only DBCS data.

**E (Either)**

Fields can contain DBCS or alphanumeric data.

## **O (Open)**

Fields can contain both DBCS and alphanumeric data.

For graphic DBCS fields:

## **G (Graphic)**

Fields can contain only DBCS data with no shift-control characters.

Data type O is allowed in all types of files. Data types J and E are allowed only in database and display files. Data type G is allowed in database, display, and printer files.

## **Keyword entries for files that use DBCS (positions 45 through 80)**

When you work with DBCS data, you can specify DBCS-specific attributes with certain DDS keywords.

Use the following keywords to perform these functions:

- Specify alternative ways to enter data through display files
- Change input- and output-capable alphanumeric data fields to DBCS data fields
- Specify the special features of the DBCS printer

### **CHRSIZ (Character Size)**

Specify this keyword for printer files to be printed on the 5553 printers. CHRSIZ can expand printed characters to twice their normal size (width and height).

### **DFNLIN (Define Line)**

Specify this keyword for printer files. DFNLIN draws horizontal or vertical lines.

### **IGCALTTYP (DBCS Alternative Data Type)**

Specify this keyword for display and printer files. IGCALTTYP changes the data type of character input- and output-capable fields from A to O (open) if IGCDTA(\*YES) is specified on the command used to create the file.

### **IGCANKCNV (Alphanumeric-to-DBCS Conversion)**

Specify this keyword for printer files (for Japanese only). IGCANKCNV converts alphanumeric characters to equivalent DBCS characters so printed alphanumeric characters have the same appearance as printed DBCS characters.

### **IGCCDEFNT (DBCS Coded Font)**

Specify this keyword for printer files. IGCCDEFNT allows you to specify the DBCS coded font for printing a named or constant field.

### **IGCCNV (DBCS Conversion)**

Specify this keyword for display files (for Japanese use only). IGCCNV allows you to use DBCS conversion, which is an alternative to directly typing in DBCS characters from a keyboard.

### **IGCCHRRTT (DBCS Character Rotation)**

Specify this keyword for printer files to be printed on the 5553 printers. IGCCHRRTT rotates each DBCS character 90 degrees counterclockwise before printing. By rotating characters, the printouts can be read vertically.

## **DBCS character strings**

You can use bracketed-DBCS character strings in DDS files for text-related keywords, such as TEXT and COLHDG, and both bracketed and DBCS-graphic character strings as parameters on the COMP, DFT, RANGE, and VALUES keywords.

## **Considerations for using DBCS character strings**

Consider the following information when you use DBCS character strings:

- Do not specify DBCS character strings for those DDS keywords that are dependent on data type, and for which you did not specify a DBCS data type (data type O, J, E, or G).
- When the source file is defined as DBCS, DDS scans all character strings as DBCS character strings and considers all data between the shift-control characters to be part of the character string.

Remember to include both shift-control characters. If the shift-in character indicating the end of the DBCS string is missing, the system considers the remainder of the record, including the ending single quotation mark, to be part of the character string.

- When the source file is alphanumeric, DDS does not check the character string to make sure that you have included only DBCS characters between the shift-control characters.
- When the source file is alphanumeric, DDS identifies DBCS character strings as alphanumeric literals.
- You can refer to a field that contains a DBCS character string from another file, using the reference function. DDS copies the attributes of the field containing the DBCS character string (the referenced field) to the field you are defining. If the file containing the referenced field is DBCS and the file you are defining is alphanumeric, DDS does not check the character string to make sure that it is a valid DBCS character string. If the file containing the referenced field is alphanumeric and the file you are defining is DBCS, DDS checks the character string to make sure that it is a valid DBCS character string.

### Enter bracketed-DBCS character strings

Enter bracketed-DBCS character strings in this way.

1. Begin the character string with a single quotation mark (').
2. Type a shift-out character.
3. Type the DBCS text.
4. Type a shift-in character.
5. End the character string with a single quotation mark (').

For example, to type the DBCS literal ABC, enter the following text, where 0<sub>E</sub> represents the shift-out character and 0<sub>F</sub> represents the shift-in character:

```
'0EABC0F'
```

### Enter DBCS-graphic character strings

Enter DBCS-graphic character strings in this way.

1. Type a G to indicate that the string contains DBCS-graphic data.
2. Begin the character string with a single quotation mark (').
3. Type a shift-out character.
4. Type the DBCS text.
5. Type a shift-in character.
6. End the character string with a single quotation mark (').

For example, to type the DBCS literal ABC, enter the following text, where 0<sub>E</sub> represents the shift-out character and 0<sub>F</sub> represents the shift-in character:

```
G'0EABC0F'
```

## DDS computer printouts with DBCS output

DDS computer printouts are printed as DBCS output in these instances.

- The source file is DBCS.
- DBCS character strings were added to the source file as a result of a reference operation.

---

## Examples: DDS coding

These topics include a wide variety of examples that illustrate how you can use DDS.

These topics provide syntax coding examples. Except for HLPARA, JFILE, JFLD, and PFILE, the keywords shown in these examples are not actual keywords. They indicate where you should specify the keywords.

[illegible]

- Note:** See the Positional entries for physical and logical files topic for a description of each of the columns shown in the figure.

<sup>1</sup> Z. ang. Math. Mech. 4, 1954, 103–104.

- 1       Comments (optional): Comments can appear on any line in DDS. They are identified by an asterisk in position 7.
- 2       File level (optional): File-level keywords appear before the record format name (RECORD1 on line 00040).
- 3       Record level (exactly one required): R in position 17 identifies RECORD1 as a record format name. In join logical files, the JFILE keyword is required for the record format. The record level continues until the first join specification.
- 4       Join level: J in position 17 identifies the beginning of a join specification. At the join level, specify at least one join specification. Each join specification must include at least one JFLD keyword. There must be one JOIN keyword for each join specification in a join logical file if there is more than one join specification in the file. A join specification continues until the next join specification or field name.
- 5       Field level: At least one field name with usage other than N is required for join logical files.
- 6       Key field level (optional): K in position 17 identifies the field as a key field. A K must be specified for each key field. Specify the key field level by repeating one or more field names (such as FIELDA) after the field-level specifications.
- 7       Select and omit levels (optional): S in position 17 identifies FIELDB as a select field. (O in position 17 identifies a field as an omit field.) The select and omit levels follow the key field level.

- 1 Comments (optional): Comments can appear on any line in DDS. They are identified by an asterisk in position 7.
- 2 File level (optional): File-level keywords appear before the first record format name (RECORDA on line 00040).
- 3 Record level (at least one required): R in position 17 identifies RECORDA as a record format name. The record level continues until either the first field is specified or the first help specification.
- 4 Help level (optional): H in position 17 identifies the beginning of a help specification. A help specification continues until the next H in position 17 or until the first field. Each help specification must include at least one HLPARA keyword, and a HLPBCD or HLPDOC keyword.
- 5 Field level (optional): Display file fields that are passed between the display device and the program must be named fields and must have a length specified. Other attributes can be specified explicitly or by default. Constant (unnamed) fields require only a location and a keyword, as described in DATE, DFT, TIME, and MSGCON keyword descriptions in DDS keyword entries for display files (position 45 through 80). Positions 17 through 38 do not apply to constant fields.

1. Items 3 through 5 can be repeated to specify new record formats within the display file.
2. See the Positional entries for display files topic for a description of each of the columns shown in the figure.

You can specify option indicators in the shaded positions.

- Comments (optional): Comments can appear on any line in DDS. They are identified by an asterisk in position 7.
- File level (optional): File-level keywords appear before the first record format name (RECORDA on line 00040).
- Record level (at least one required): R in position 17 identifies RECORDA as a record format name. The record level continues until the first field is specified.
- Field level (optional): ICF file fields must have at least a name (as in FIELD A) and a length. Other attributes can be specified explicitly or by default.

#### Notes:

- Items 3 and 4 can be repeated to specify new record formats within the ICF file.
- See the Positional entries for ICF files topic for a description of each of the columns shown in the figure.

## Examples: DDS for each file type

This topic provides examples of data description specifications (DDS) for each type of file discussed in this topic. If you choose, you can use the examples in this topic with appropriate high-level language programs.

- Examples of database files include the following types:
  - Field reference file (a physical file used for reference, not data storage)
  - Physical file
  - Logical file
- Examples of device files include the following types:
  - Display file with help specifications

- Subfile examples
- Printer file
- ICF file

### Example: A field reference file

This example defines all of the fields used in an application and refers to fields only within the field reference file itself.

The following keywords are important in the example:

COLHDG  
EDTCDE(Z)  
REFFLD  
REFSHIFT  
TEXT

The following field reference file (MLGREFP) describes all fields used by any program in the application. The other files use the fields in this file.

```
|...+....1....+....2....+....3....+....4....+....5....+....6....+....7....+....8
00010A** FLDREF  MLGREFP  MAILING LIST FIELD REFERENCE FILE
00020A  (1)R MLGREFR          TEXT('Mailing List Field Reference')
00030A          ACTNUM      5 0      COLHDG('Account' 'Number')
00040A          EDTCDE(Z)
00050A          ACTTYP      1 0      COLHDG('Acct' 'Type')
00060A          TEXT('Acct Type 1=Bus 2=Gvt +
00070A          3=Org 4=Sch 5=Pvt 9=Oth')
00080A          NAME        18      COLHDG('Name')
00090A          REFSHIFT(X) (4)
00100A          ADDR        R (2)    (2)REFFLD(NAME)
00110A          COLHDG('Address') (3)
00120A          CITY        R (2)    (2)REFFLD(NAME)
00130A          COLHDG('City') (3)
00140A          STATE        2      COLHDG('State')
00150A          ZIP          5 0      COLHDG('ZIP' 'Code')
00160A          EDTCDE(X)
00170A          BATNUM      6 0      COLHDG('Batch' 'Number')
00180A          EDTCDE(Z)
00190A          TRNTYP      1      COLHDG('Trans' 'Type')
A

|...+....1....+....2....+....3....+....4....+....5....+....6....+....7....+....8
00200A          TEXT('Trans Type A=Add +
00210A          C=Change D=Delete')
00220A          XACTNM      R      REFFLD(ACTNUM)
00230A          XACTTTP      R      REFFLD(ACTTYP)
00240A          XNAME        R      REFFLD(NAME)
00250A          XADDR        R      REFFLD(ADDR)
00260A          XCITY        R      REFFLD(CITY)
00270A          XSTATE      R      REFFLD(STATE)
00280A          XZIP          R      REFFLD(ZIP)
00290A          TRNNUM      5 0      COLHDG('Transaction' 'Number')
00300A          EDTCDE(Z)
00310A          MLGLK1      3 0      COLHDG('Lock' 'Control')
00320A          TEXT('Control Number Used for +
00330A          record locking')
A
```

Figure 2. DDS for a field reference file

### Legend:

- (1) Like all physical files, a field reference file has only one record format. The R in position 17 specifies that MLGREFR is the record format name.
- (2) The Rs in position 29 and REFFLD in positions 45 through 80 specify that the fields ADDR and CITY are to have the same attributes as NAME.
- (3) Specifying COLHDG for ADDR and CITY overrides the COLHDG attribute for NAME, which otherwise will be in effect.
- (4) Specifying REFSHIFT for NAME will cause the keyboard shift specified (X) to be used when this field (NAME) is referred to in a display file.

### Example: A physical file with a new record format

The REF keyword is important in this example. This file has one record format. The names of all fields in the record format are specified. This example uses fields in a reference file (REF keyword) and uses a keyed-sequence access path.

The following physical file (called CUSMSTP for customer master physical file) describes the fields physically present in the database.

```
|...+....1....+....2....+....3....+....4....+....5....+....6....+....7....+....8
00010A*
00020A* SAMPLE PHYSICAL FILE(CUSMSTP)
00030A*
00040A          (1) REF(MLGREFP)
00050A          (2) R CUSMST          TEXT('Customer Master Record')
00060A          ACTNUM      R  (3)
00070A          NAME        R  (3)
00080A          ADDR        R  (3)
00090A          CITY        R  (3)
00100A          STATE       R  (3)
00110A          ZIP         R  (3)
00120A          (4) SEARCH      10  0
00130A          (4) CRDLMT      8   2
00140A          (5) K ACTNUM
A
```

Figure 3. DDS for a physical file

#### Legend:

- (1) At the file level, the REF keyword refers the i5/OS operating system to the physical file MLGREFP, which is a field reference file for this database.
- (2) At the record level, R in position 17 specifies that CUSMST is the record format name of the record in this file. (There can only be one record format in a physical file.)
- (3) At the field level, Rs in position 29 specify that the attributes of fields of the same name in the REF file are to be used as attributes of these fields.
- (4) The fields SEARCH and CRDLMT are not defined in MLGREFP; therefore, their field attributes are specified here.
- (5) At the key field level, K in position 17 specifies that ACTNUM is the key field for the file.

### Example: A logical file specifying multiple formats and new keys

The PFILE keyword is important in this example. The example uses new field specifications and provides two record formats. Each record format provides a different view of the associated physical file and uses a key different from the associated physical file.

```

|...+....1....+....2....+....3....+....4....+....5....+....6....+....7....+....8
00010A*
00020A* SAMPLE LOGICAL FILE
00030A
00040A      R CUSMST1      (1)PFILE(CUSMSTP)
00050A      ACTNUM
00060A      NAME
00070A      STATE
00080A      LASTNAME      I  (3)SST(NAME 8 10)
00090A  (2)  K ACTNUM
00100A*
00110A      R CUSMST2      (1)PFILE(CUSMSTP)
00120A      ACTNUM
00130A      NAME
00140A      ZIP
00150A      K *NONE
00160A  (2)  K NAME
      A

```

Figure 4. DDS for a logical file specifying new keys

#### Legend:

- (1) The two record formats (CUSMST1 and CUSMST2) in this logical file are based on the same physical file (CUSMSTP).
- (2) Record format CUSMST1 has a key different from record format CUSMST2, providing the application program with a different sequence of the same records.
- (3) The LASTNAME field is a substring of the field NAME. The usage I in position 38 must be specified because this is not a join logical file.

#### Example: A logical file specifying a new record format

The UNIQUE keyword is important in this example. The example specifies a record format different from the associated physical file.

The following logical file (called CUSMSTL2 for customer master logical file two) uses some of the fields in the physical file CUSMSTP. Another logical file can name all fields, name fields in other physical files as well, concatenate fields, change the order of fields, rename fields, or choose different key fields. In this logical file, the programmer merely omitted some fields from the physical file.

```

|...+....1....+....2....+....3....+....4....+....5....+....6....+....7....+....8
00010A*
00020A* SAMPLE LOGICAL FILE (CUSMSTL2)
00030A*
00040A      (1)UNIQUE
00050A      R CUSREC      (2)PFILE(CUSMSTP)
00060A      TEXT('Logical File Master Record')
00070A      ACTNUM  (3)
00080A      NAME    (3)
00090A      ADDR    (3)
00100A  (4)K ACTNUM
      A

```

Figure 5. DDS for a logical file

#### Legend:

- (1) The UNIQUE keyword specifies that records with duplicate keys are not allowed within a member of this logical file.
- (2) The keyword PFILE (required for logical files) specifies CUSMSTP.

- (3) The field names do not have R specified in position 29 as they do in physical files or in any device file.
- (4) As in CUSMSTP, the field ACTNUM is treated as a key field.

### Example: A join logical file

The join logical file joins three physical files (PF1, PF2, and PF3) in this example, so that an application program can get name, address, and salary information in one input operation, even though the information is stored in three different physical files.

The following keywords are important in the example:

- JFILE
- JFLD
- JOIN
- JREF

	1	2	3	4	5	6	7	8
00010A	(1)R	JOINREC		(2)	JFILE(PF1 PF2 PF3)			
00020A		J			JOIN(PF1 PF2)			
00030A	(3)				JFLD(NAME NAME)			
00040A		J			JOIN(PF2 PF3)			
00050A					JFLD(NAME NAME)			
00060A	(4)	NAME		(5)	JREF(1)			
00070A	(4)	ADDR						
00080A	(4)	PHONE						
00090A	(4)	SALARY						
A								

Figure 6. DDS for a join logical file

#### Legend:

- (1) R identifies the record format. There can be only one record format in a join logical file.
- (2) The JFILE keyword specifies that PF1, PF2, and PF3 are the physical files on which this join logical file is based. Because it is specified first, PF1 is the primary file. There are two secondary files: PF2 and PF3.
- (3) J identifies the join specifications. With two secondary files in this join logical file, there must be two join specifications. Each join specification defines how a pair of files is to be joined, as follows:
  - JOIN is required when more than two physical files are being joined, and it identifies which two files are being joined in this join specification. In the first join specification, PF1 and PF2 are joined. In the second join specification, PF2 and PF3 are joined.

**Note:** Secondary files can be joined to either the primary file or to another secondary file. In this example, PF2 in the second JOIN keyword can be PF1. There is no difference in the order of records supplied to the program or in performance.

- JFLD identifies which fields are used to link together records from the physical files being joined. In the first join specification, NAME from PF1 links with NAME from PF2. In the second join specification, NAME from PF2 links with NAME from PF3.
- (4) The field names show which fields are presented to the program. At least one field name is required.
  - (5) The JREF keyword identifies which physical file to search for the field name; in this example, NAME from PF1 is used. Note the use of the direct file number: JREF(1) indicates to use the first file on the JFILE keyword, which is PF1.

## Example: An inquiry display with two record formats in DDS

The display is defined by the DDS in this example. It is displayed by output operations to the record formats PROMPT and RESPONSE.

CUSTOMER FILE ADD/UPDATE

Enter new or existing customer number  
Enter A to ADD new Customer

Name       XXXXXXXXXXXXXXXXXXXXX  
Address     XXXXXXXXXXXXXXXXXXXXX  
City        XXXXXXXXXXXXXXXXXXXXX  
State     XX        Zip code NNNNN

Credit limit       \$NNN,NNN.NN

F3 - End Program & Print Report   F6 - Return to prompt

Name XXXXXXXXXXXXXXXXXXXXXXXX

If the cursor is positioned in the area with Xs on the NAME field and the Help key is pressed, online help information will appear.

The following keywords are important in the example:

CAnn	HELP
CHECK	HLPARA
DSPATR(HI BL)	HLPRCD
DSPATR(UL)	HLPBDY
EDTCDE(Y)	HLPDOC
EDTCDE(2 \$)	OVERLAY
ERRMSG	PRINT

The example uses +n to specify position.

Figure 7. Display with two record formats

### Legend:

- (1) The PRINT keyword allows the display station user to print the display at any time by pressing the Print key.
- (2) An application program displays a prompt by issuing an output operation to the record

PROMPT, displaying the constant fields 'CUSTOMER FILE ADD/UPDATE', 'ENTER EXISTING CUSTOMER NUMBER', 'ENTER A TO ADD NEW CUSTOMER', and the named fields ACTNUM and ADD.

- (3) The CHECK(MF) keyword specifies that when the user types into one position of the field ACTNUM, he must type into all five positions before pressing the Enter key, or an error message is displayed and the keyboard is locked. The user must press the Reset key and reenter through the input field.
- (4) If record format PROMPT is displayed and your program sets on indicator 40 when an output operation is sent to record format PROMPT, the error message 'Customer number not found' is displayed on the message line (line 24 of the 24-line display unless the MSGLOC keyword is specified). The message is highlighted, field ACTNUM is displayed with its image reversed, and the keyboard is locked until the user presses the Reset key.
- (5) After the user presses the Enter key, the application program retrieves the required information from the database and sends an output operation to record format RESPONSE, displaying the fields described in the next paragraphs.
- (6) The OVERLAY keyword specifies that an output operation to this record format (RESPONSE) does not cause the entire display to be cleared, as it is by default.
- (7) The HELP keyword enables the Help key for this display.
- (8) The HLPDOC keyword specified at the file level identifies the document to be displayed when no help area for the active records contains the current cursor location.
- (9) The HLPDOC and HLPARA keywords on this H specification specify that the HELP#1 document in the HELP folder will be displayed starting at the LBL1 help label if the Help key is pressed while the cursor is in positions 2 through 50 of line 2.
- (10) The HLPRCD and HLPARA keywords on this H specification cause the record NAMEHELP to be displayed if the Help key is pressed while the cursor is in positions 10 through 28 of line 6. The record NAMEHELP is defined in this display file; therefore, a file name does not have to be specified on the HLPRCD keyword.

**Note:** When using application help keywords, the screen is automatically cleared.

- (11) The HLPRCD and HLPARA keywords on this H specification cause the ADDRHELP record to be displayed if the Help key is pressed while the cursor is in positions 10 through 28 of line 7, 8, or 9.
- (12) The HLPBDY keyword limits the help records displayed when the Page key is pressed. If either NAMEHELP or ADDRHELP is displayed when the Help key is pressed, the NAMEHELP and ADDRHELP records are accessible using the Page key. If HELPRCD1 is displayed when the Help key is pressed, the help records from other H specifications are not accessible using the Page key.
- (13) The HLPRCD and HLPARA keywords on this H specification cause the record HELPRCD1 in the file HELPFIL to be displayed if the Help key is pressed while the cursor is in positions 18 through 40 of lines 12 through 40. This record is in a separate display file called HELPFIL.
- (14) Five constant fields ('Name', 'Address', 'City', 'State', and 'Zip Code') and five named fields (NAME, ADDRES, CITY, STATE, ZIP) are grouped together on the display by the line/position specifications. NAME, ADDRES, CITY, and STATE default to character-type fields (A in position 35) because no decimal positions are specified. ZIP is a numeric-only, integer field (Y in position 35; 0 in position 37), so its display length equals its specified length.
- (15) The field CRDLMT is specified with EDTCDE (2 \$). EDTCDE(2) is used for monetary amounts, and the \$ specifies the floating currency symbol.
- (16) The DSPATR(H1) keyword highlights the field CRDLMT.

- (17) Instructions to the workstation user are generally located at the bottom of the display, just above the message line.

### Example: A subfile with SFLPAG value equal to SFLSIZ value

The display is defined by the DDS in this example. It is displayed by an output operation to the subfile control-record format SFLCTL1.

[illegible]

The following keywords are important in the example:

ROLLDOWN	SFLDSPCTL
ROLLUP	SFLPAG
SFLCLR	SFLSIZ
SFLDSP	

The file in Figure 8 has one column of subfile records. Constant fields in the subfile control-record format are used as headings for columns of fields in the subfile records.

	1	2	3	4	5	6	7	8
00010A*	USE OF	SUBFILE	KEYWORDS					
00020A	(1)	R SFL1			SFL			
00030A	(2)	FLD1	10	0I	3	11		
00040A	(2)	FLD2	16	0	3	26		
00050A								
00060A	(1)	R SFLCTL1			SFLCTL(SFL1)			
00070A					SFLSIZ(18)		(3)	
00080A					SFLPAG(18)		(3)	
00090A	05				SFLDSP		(4)	
00100A	05				SFLDSPCTL		(4)	
00110A	N05				SFLCLR		(5)	
00120A					ROLLUP(01)	ROLLDOWN(02)	(6)	
00130A				1	11	'First Field'	(7)	
00140A				1	26	'Second Field'	(7)	
A								

Figure 8. Subfile with subfile size equal to subfile page

**Legend:**

- (1) The subfile record format SFL1 and the subfile control-record format SFLCTL1 together define one subfile. The parameter value for the SFLCTL keyword is the name of the subfile record format.

- (2) Each subfile record is made up of two fields: FLD1 and FLD2. FLD1 is 10 bytes long (11 bytes display length because it defaults to signed numeric); FLD2 is 16 bytes long. FLD1 is an input-only field; FLD2 is an output-only field. Eighteen subfile records appear on the display, with the first one on line 3 and the last one on line 20. For each subfile record on the display, two fields (FLD1 and FLD2) appear, with four spaces between FLD1 and FLD2.
- (3) SFLSIZ and SFLPAG (required keywords) have equal values (18). Therefore one page equals the whole subfile. For all subfiles, the value of the SFLPAG keyword is the number of subfile records displayed at any one time (unless the SFLDROP keyword or variable-length records are used).
- (4) SFLDSP (a required keyword) and SFLDSPCTL (an optional keyword) are specified with indicator 05. Therefore, when indicator 05 is set on, the subfile and subfile control records can be displayed by an output operation to the subfile control-record format SFLCTL1.
- (5) SFLCLR (an optional keyword) is specified with option indicator 05 preceded by an N. When indicator 05 is set off, the subfile can be cleared by an output operation to SFLCTL1.
- (6) ROLLUP (an optional keyword) is specified with response indicator 01, and ROLLDOWN (an optional keyword) is specified with response indicator 02. Note also that the entire subfile equals one page, which means that the whole subfile is displayed at one time. Therefore, when the display station user presses the Page Up key, control passes to the program with indicator 01 on, and when the workstation user presses the Page Down key, control passes to the program with indicator 02 on. The program must handle paging, by reading, clearing, rewriting, and redisplaying the subfile. Without ROLLUP and ROLLDOWN specified, the workstation user will receive an error message when pressing the Page Up or Page Down key.
- (7) Two constants ('First Field' and 'Second Field') are displayed when the subfile control-record is displayed (SFLDSPCTL in effect). As specified in this subfile, they act as column headings to the subfile records.

**Example: A subfile with paging by i5/OS operating system and high-level language program**

This example describes a combined method of paging a subfile that uses system resources efficiently.

In some applications, the number of records in the subfile might be quite large. However, the application user might want to view only the first page or two of these records. In this case, it might be faster and more efficient for the application program to build the subfile a page at a time as requested by the user. The i5/OS operating system handles the paging of records in the subfile. It also returns a Page Up key indicator to the high-level language program when another page should be added to the end of the subfile. The application user can detect no difference between a page-up request handled by the i5/OS operating system and one handled by the high-level language program.

[illegible]

The following keywords are important in the example:

SFLPAG  
SFLSIZ

The SFLSIZ value is larger than the SFLPAG value. The subfile is paged by the SFLPAG value.

```

```

Figure 9. Subfile with paging by i5/OS operating system and high-level language program in DDS

#### Legend:

- (1) The SFLSIZ value must be greater than the SFLPAG value so that the i5/OS operating system will handle paging within the subfile. A maximum of 9999 records can be stored in the subfile.
- (2) The SFLEND keyword can be specified with the ROLLUP keyword. One indicator can be used to option both keywords. The application program turns on the indicator to disable the Page Up key and omit the plus sign (+) on the last subfile page when the last page of the subfile is displayed.
- (3) The SFLRCDNBR keyword should be specified so the last subfile page can be displayed after it is built by the high-level language program.

Records in the subfile with changed input fields (modified data tags) will be changed after a new page is added to the subfile by the high-level language program.

#### Example: A horizontal subfile displayable on two display sizes

The two displays show the subfile defined in this example as it appears on the 24 x 80 and 27 x 132 display sizes.

COLUMN 1	COLUMN 2
_____ XXXXXXXXXXXXXXXX	_____ XXXXXXXXXXXXXXXX
_____ XXXXXXXXXXXXXXXX	_____ XXXXXXXXXXXXXXXX
_____ XXXXXXXXXXXXXXXX	_____ XXXXXXXXXXXXXXXX
_____ XXXXXXXXXXXXXXXX	_____ XXXXXXXXXXXXXXXX
_____ XXXXXXXXXXXXXXXX	_____ XXXXXXXXXXXXXXXX
_____ XXXXXXXXXXXXXXXX	_____ XXXXXXXXXXXXXXXX
_____ XXXXXXXXXXXXXXXX	_____ XXXXXXXXXXXXXXXX
_____ XXXXXXXXXXXXXXXX	_____ XXXXXXXXXXXXXXXX

[illegible]

The following keywords are important in the example:

DSPSIZ  
SFLLIN

Subfile records appear in two columns (SFLLIN keyword). The subfile can be displayed on two display sizes (DSPSIZ keyword).

```

|...+...1...+...2...+...3...+...4...+...5...+...6...+...7...+...8

Figure 10. Horizontal subfile on two display sizes

**Legend:**

- (1) There is one keyword at the file level, the keyword DSPSIZ (optional). This keyword has two values, \*DS3 and \*DS4, which indicate that the primary display size is 24 x 80, and the secondary display size is 27 x 132.
- (2) The SFLPAG keyword (required), is specified once with a value of 16 and again with a value of

(3) The SFLLIN keyword causes a subfile to be displayed horizontally. The parameter value specifies the number of spaces between columns of records. In this example, five spaces separate columns of records on both the 24 x 80 display size (\*DS3) and the 27 x 132 display size (\*DS4). Because \*DS3 is the primary display size, it does not need to be specified in positions 9 through 12.

The display shows the message subfile defined in this example.

MESSAGE SUBFILE

SFLMSGKEY  
SFLPGMQ  
SFLMSGRCD

	...	1	...	2	...	3	...	4	...	5	...	6	...	7	...	8
00010A*																
00020A*	MESSAGE SUBFILE															
00030A*																
00040A						R	SFLR									SFL
00050A																SFLMSGRCD(3) (1)
00060A							MSGKEY	(2)								SFLMSGKEY (2)
00070A							PGMQ	(2)								SFLPGMQ (2)
A																
00080A						R	STLCTLR									SFLCTL(SFLR)
00090A																SFLSIZ(12) (3)
00100A																SFLPAG(6) (3)
00110A	01															SFLDSP
00120A	02															SFLDSPCTL
00130A	03															SFLCLR
00140A	04															SFLEND (3)
A																
A																
00150A	1 32'MESSAGE SUBFILE'															
A																

**Legend:**

- (1) Specifying the SFLMSGRCDD keyword on the subfile record format identifies this subfile as a *message subfile*. The parameter value specified causes the subfile to appear on line 3 of the display.
- (2) The fields MSGKEY and PGMQ are user-defined names given to the two fields required for the subfile record format for a message subfile. The only specifications allowed for them are their names and the SFLMSGKEY and SFLPGMQ keywords, in the order shown.

This subfile is built by a series of output operations to SFLR that place messages in the subfile as subfile records. Messages are truncated to fit single lines (76 characters or 128 characters, depending on display size), and second-level help is available. This subfile is displayed by an output operation to SFLCTLR with option indicator 01 set on.

- (3) This subfile is paged by the i5/OS operating system when the display station user presses a Page Up or a Page Down key. The SFLEND keyword allows the i5/OS operating system to display a plus sign whenever the subfile can be paged up.

### **Example: A printer file using DDS**

This printer file example contains DDS for printing a customer master list.

The following keywords are important in the example:

EDTCDE(Y)	UNDERLINE
EDTCDE(Z)	BARCODE
PAGNBR	CHRSIZ
SKIPB	COLOR
SPACEA	

This printer file uses space and skip keywords instead of line numbers.

Figure 12. Printer file

#### Legend:

- (1) This printer file refers to the field reference file MLGREFP.
- (2) When SKIPB(2) is specified at the record level, the printer skips to line 2 before printing the record format (HEADER). Also, line numbers in positions 39 through 41 are not allowed.
- (3) UNDERLINE is a field-level keyword that causes the constant field preceding it to be underlined on the printout.
- (4) The CHRSIZ keyword specified here causes the ACTNBR field to print with its height and width expanded by 2.
- (5) The COLOR keyword causes the NAME field to print in blue if you use a printer that supports color (the 4224 Printer).
- (6) The BARCODE keyword specified for the STATE field causes the CODE30F9 bar code to print for the STATE field if you use an IPDS™ printer.

#### Example: An ICF file using DDS

This example contains DDS for transmitting data between the iSeries server and a remote system or device.

The following keywords are important in the example:

CONFIRM	RECID
DETACH	SYNLVL
EVOKE	EOS
RCVDETACH	RSPCONFIRM
RCVFAIL	ALWWRT
RCVCONFIRM	FAIL
RCVTRNRND	RQSWRT

```

Figure 13. ICF file

#### Legend:

- (1) The record format SNDEVOKE causes the program specified in the field PGMNME and the library specified in the field LIBNME to be started on the remote system. It also establishes a

synchronization level of \*CONFIRM for the transaction and passes the data in the field PASSWRD as security information. The CONFIRM keyword requests that the remote system confirm the start of the program.

(2) If the remote program performs any of the following actions:

- Requests to end sending data
- Requests to end the transaction
- Requests to confirm receiving the data
- Sends a FAIL

this sets on one of the following response indicators:

- 01 (the RCVTRNRND keyword)
- 02 (the RCVDETACH keyword)
- 03 (the RCVCONFIRM keyword)
- 04 (the RCVFAIL keyword)

(3) The EOS keyword causes the session to end if indicator 01 is on and the program issues an output operation.

(4) The iSeries server sends and receives data in the form of header (record format HEADER) and detail (record format DETAIL) records. If your program is sending, option indicator 09 can be set on (enabling the CONFIRM keyword) to request the remote system to confirm receiving the data.

When receiving data, the record selection processing (RECID keyword) determines which record is received. If an H is in position 1, record format HEADER is selected. If a D or E is in position 1, record format DETAIL is selected. If anything else is in position 1 (unexpected record format, application error, or indicators with no data, RCVDETACH, RCVFAIL, and so on), record format CATCHALL is selected.

(5) Record format, COMMANDS, is used to request the following communications functions:

- If indicator 05 is on, the FAIL function is performed.
- If indicator 06 is on, the ALWWRT function is performed.
- If indicator 07 is on, the DETACH function is performed.
- If indicator 08 is on, the RQSWRT function is performed.
- If indicator 09 is on, the CONFIRM function is performed.
- If indicator 10 is on, the RSPCONFIRM function is performed.

## Example: Program that uses a physical, display, and printer file

This sample program shown in this topic illustrates the use of externally described data in a program.

If you enter the DDS for these files on your system and create them using the Create Physical File (CRTPF) command, the Create Display File (CRTDSPF) command, and the Create Printer File (CRTPRTF) command, this program allows you to add records to the physical file, display and update the records, and print a report.

The program is written in Report Program Generator (RPG). You can enter the RPG specifications shown in the example into a source file on your system and create the program using the Create RPG Program (CRTRPGPGM) command. For more information about RPG, see the *RPG/400® Reference* manual on the

V5R1 Supplemental Manuals  Web site.

**Note:** By using the code examples, you agree to the terms of the “Code license and disclaimer information” on page 45.

For the valid entries for a system, refer to the RISC reference manual for that system

[illegible]

**Legend:**

- ## 38 DDS concepts

value is found, indicator 30 is turned on. The program continues to prompt until the key value of an existing record is entered in field ACTNUM (indicator 30 off) or an A is entered in field ADD.

- 5 This section adds a new record or updates an existing record in the database file.

If a new customer is being added (indicator 30 is on), the WRITE op code adds a new record to the physical file. Otherwise, the UPDAT op code updates an existing record. The program continues to prompt for, retrieve, add, and update records in the physical file until F3 is pressed, setting on indicator 21.

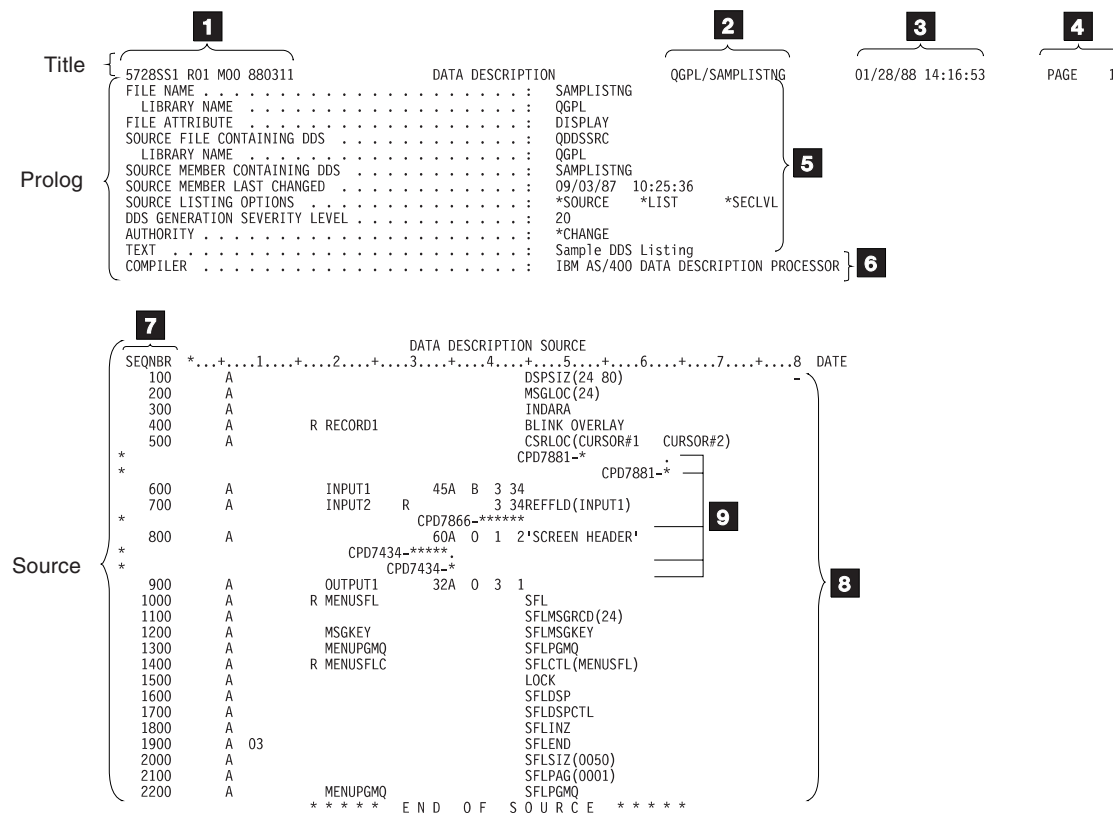

- 6 This section prints the report.

A record is read from the physical file and the DETAIL record is written to the printer file until the end of the physical file is reached (indicator 45 is set on). The HEADER record is written on the first page and then written again on each new page (indicator 10 is on). When all the records have been written, the CLOSE op code closes all the files and SETON LR ends the program.

## Example: DDS compiler listing

This is an example of a DDS compiler computer printout.

After data description specifications are written, they must be put into a source file. Then, database or device files are created by entering the CL command that starts the data description processor. You can enter the CL command interactively or in a batch job. The data description processor retrieves the data description specifications from the source file designated on the CL command that creates the file, validates the specifications, and creates a computer printout with any errors and any referenced specifications, as this example illustrates.

RSLL914-2

## Compiler listing title (appears at top of each output page):

- 1 The program number, release modification level, and date of the i5/OS operating system.
- 2 The qualified name.
- 3 The date and time of this run.
- 4 The page number in the computer printout.

## Compiler listing prolog:

- 5 The type of file and the parameter values specified (or defaults if not specified) on the CL command that creates the file.
- 6 The name of the DDS processor.

## Compiler listing source:

- 7 The sequence numbers of lines (records) in the source. Comments are treated like any other specification line and are given sequence numbers.

- 8        The source specifications.
- 9        If an error is found during processing of the DDS and can be traced specifically to a source specification, the error message identifier and an asterisk indicating where the error is are printed immediately following the source specification line. An asterisk is also printed under the sequence number to indicate that the line contains an error message.

**Compiler listing expanded source:**

- 10       Only the valid DDS. This list is what is actually in the file description. No comments or messages are printed. Default values and referenced values are printed for the valid DDS.
- 11       The length and the buffer (input or output) position of each field.

**Compiler listing messages:**

- 12       This section contains a list of all messages (general messages and those already indicated in the source section) encountered during processing of the DDS. For each message, the message identifier, the severity, the number of times the message occurred, and the message text are listed.

**Compiler listing message summary:**

- 13       The number of messages at each severity level.
- 14       The final completion message.

**Related tasks**

“Create the DDS file” on page 4

Create the file by running a CL command that corresponds to the type of DDS file you are creating.

## **DDS debugging template**

A special template is available to help you in interpreting the fields on the DDS compiler computer printout.

The following figure shows a reduced debugging template.

- Whose name differs from the name of the field it references. This includes fields that reference fields in the file you are defining.
  - Do you need a database file name for each REFFLD keyword you specify?  
The database file name specified on a REFFLD keyword overrides the database file name specified on the REF keyword.  
On the REFFLD keyword, you can specify:
    - \*SRC so that the i5/OS operating system searches the file you are defining for the referenced field. The referenced field must be defined before you define the field that references it.
    - The name of the database file that the i5/OS operating system is to search through to find the referenced field.
- If you do not specify \*SRC or a database file name on the REFFLD keyword, the default is \*SRC if the REF keyword is not specified. If the REF keyword is specified, the default is the database file name specified on the REF keyword.
- Is a library name necessary for each database file you specify?  
If the job that will create the file you are defining (perhaps your interactive job) has a library list, and the database file you specified is on the library list, enter only the file name (FILE1). Otherwise, specify the file name qualified by the library name (LIB1/FILE1).
  - Do you need a record format name for each REF or REFFLD keyword you specify?  
If the file you reference has only one record format, do not specify a record format name.  
If it has more than one record format, specify a record format name.

The following example illustrates reference function specifications. It is not a valid example of any file except an ICF file. Display and printer files must have a location specified for each field. Physical files can have only one record format. The REF and REFFLD keywords are not allowed in logical files.

	1	2	3	4	5	6	7	8
00010A					REF(FILE1)	(1)		
00020A	R RECORD1							
00030A	FIELD1	R				(1)		
00040A	FIELD2	R				(1)		
00050A	FIELD3	R		REFFLD(FLD3)	(2)			
00060A	FIELD4	R		REFFLD(FLD4 FILE2)	(3)			
00070A	FIELD5	R		REFFLD(FLD5 LIB1/FILE3)	(4)			
00080A	FIELD6	R		REFFLD(RECORDB/FLD6 LIB1/FILE4)	(5)			
00090A	FIELD7	R		REFFLD(FIELD6 *SRC)	(6)			
00100A	FIELD8	R		REFFLD(FLD6)	(7)			
00110A	R RECORD2							
00120A	FIELD1		20	(8)				
00130A								
00140A	R RECORD3							
00150A	FIELD1	R		REFFLD(RECORD2/FIELD1 *SRC)	(9)			
00160A								
00170A	R RECORD4							
00180A	FIELD1	R		REFFLD(FIELD1 *SRC)	(10)			

**Note:** For line 00010, you can also specify library name and record format name. See the REF keyword example.

*Figure 16. Sample Reference Function Specifications*

#### Legend:

- 1 FIELD1 and FIELD2 have the same attributes as FIELD1 and FIELD2 in FILE1.
- 2 FIELD3 has the same attributes as FLD3 in FILE1.
- 3 FIELD4 has the same attributes as FLD4 in FILE2.
- 4 FIELD5 has the same attributes as FLD5 in FILE3 in LIB1.

- 5 FIELD6 has the same attributes as FLD6 in record format RECORDB in FILE4 in LIB1.
- 6 FIELD7 has the same attributes as FIELD6 (on the preceding line in this file).
- 7 FIELD8 has the same attributes as FLD6 in FILE1.
- 8 FIELD1 in RECORD2 has unique field attributes. (It does not use the reference function; notice that R is not specified in position 29.)
- 9 FIELD1 in RECORD3 has the same attributes as FIELD1 in RECORD2.
- 10 FIELD1 in RECORD4 has the same attributes as FIELD1 in RECORD1.

## Related information for DDS concepts

Listed here are the product manuals (in PDF format) and information center topics that relate to the DDS concept topic. You can view or print any of the PDFs.

### Manuals

- Backup and Recovery  describes how to make copies of the system and database files for safe keeping.
- *Advanced Function Printing™: Data Stream Reference*, S544-3202, provides information about the Advanced Function Printing data stream.
- See the *ADTS for AS/400: Screen Design Aid* manual on the V5R1 Supplemental Manuals  Web site. It provides the application programmer, system programmer, or data processing manager with information about using the WebSphere Development Studio screen design aid (SDA) to design, create, and maintain display formats and menus.
- See the *ADTS for AS/400: Source Entry Utility* manual on the V5R1 Supplemental Manuals  Web site. It provides the application programmer or system programmer with information about using the WebSphere Development Studio source entry utility (SEU) to create and edit source members.
- Application Display Programming  describes the use of display devices by application programs.
- Printer Device Programming  provides information to help the programmer manage key aspects of the system. For example, it describes how to use printer files.
- *IBM Personal Computer Enhanced 5250 Emulation Program Version 2.12 Technical Reference*, GS57-0222-02, provides the information about the 5250 Emulation Program.
- *Intelligent Printer Data Stream™ Reference*, S544-3417, provides information about bar codes and valid check digits.
- See the *RPG/400 Reference* manual on the V5R1 Supplemental Manuals  Web site. It describes how to design, code, enter, compile, test, and run RPG III programs.
- CL Programming  provides a wide-range discussion of programming topics.

### Other information

- Control language describes control language syntax, commands, and command parameters.
- Work management provides information about how to create and change a work management environment.
- Basic system operations describes how to operate workstations and how to use the function keys to enter commands.
- *Experience RPG IV Tutorial* is an interactive self-study program explaining the differences between RPG III and RPG IV and how to work within the new ILE environment. An accompanying workbook

provides additional exercises and doubles as a reference upon completion of the tutorial. RPG code examples are shipped with the tutorial and run directly on i5/OS. Dial 1-800-IBM-CALL to order the tutorial.

## **Saving PDF files**

To save a PDF on your workstation for viewing or printing:

1. Right-click the PDF in your browser (right-click the link above).
2. Click the option that saves the PDF locally.
3. Navigate to the directory in which you want to save the PDF.
4. Click **Save**.

## **Downloading Adobe Reader**

You need Adobe Reader installed on your system to view or print these PDFs. You can download a free copy from the Adobe Web site ([www.adobe.com/products/acrobat/readstep.html](http://www.adobe.com/products/acrobat/readstep.html)) .
