Tables.....	xvii
About this guide.....	xxiii
Who should use this guide.....	xxiii
Accessibility.....	xxiii
Emphasis.....	xxiii
Publications and related libraries.....	xxiii
Feedback.....	xxiv
Syntax diagrams.....	xxv
Terminology.....	xxvi
CLI special characters.....	xxvii
Using wildcards in the CLI.....	xxvii
Data types and value ranges.....	xxviii
CLI commands and parameters.....	xxxiii
CLI flags.....	xxxiv
CLI messages.....	xxxiv
CLI deprecated and discontinued commands.....	xxxiv
Understanding capacity indicators	xxxvi
Attributes of the -filtervalue parameters.....	xxxvii
Chapter 1. Setting up an SSH client.....	1
Setting up an SSH client on a Windows host.....	2
Generating an SSH key pair using PuTTY.....	2
Configuring a PuTTY session for the CLI.....	3
Connecting to the CLI using PuTTY.....	3
Starting a PuTTY session for the CLI.....	5
Preparing the SSH client on an AIX or Linux host.....	6
Generating an SSH key pair using OpenSSH.....	6
Connecting to the CLI with OpenSSH.....	7
Working with local and remote users.....	7
UNIX commands available in interactive SSH sessions.....	8
Copying the software update files by using PuTTY pscp or openssh scp.....	8
Chapter 2. Using the CLI.....	11
Setting the clustered system time by using the CLI.....	11
Setting cluster date and time.....	12
Viewing and updating license settings by using the CLI.....	12
Displaying clustered system properties by using the CLI.....	13
Maintaining passwords using the CLI.....	14
Using the dump commands to work with directories.....	15
Re-adding a repaired node to a clustered system by using the CLI.....	16
Displaying node properties by using the CLI.....	19
Discovering MDisks using the CLI.....	20
Creating storage pools using the CLI.....	21
Adding MDisks to storage pools using the CLI.....	23
Setting a quorum disk using the CLI.....	24
Modifying the amount of available memory for Copy Services, Volume Mirroring, and RAID arrays by using the CLI.....	25
Creating volumes using the CLI.....	28
Adding a copy to a volume.....	30

Deleting a copy from a volume.....	31
Configuring host objects.....	31
Creating host mappings by using the CLI.....	32
Creating FlashCopy mappings by using the CLI.....	33
Preparing and starting a FlashCopy mapping by using the CLI.....	34
Stopping FlashCopy mappings by using the CLI.....	35
Deleting a FlashCopy mapping using the CLI.....	35
Creating a FlashCopy consistency group and adding mappings using the CLI.....	36
Preparing and starting a FlashCopy consistency group using the CLI.....	37
Stopping a FlashCopy consistency group using the CLI.....	39
Deleting a FlashCopy consistency group using the CLI.....	39
Creating Metro Mirror, Global Mirror, or active-active relationships by using the CLI.....	40
Modifying Metro Mirror, Global Mirror, or active-active relationships by using the CLI.....	41
Starting and stopping Metro Mirror, Global Mirror, or active-active relationships by using the CLI.....	41
Displaying the progress of Metro Mirror, Global Mirror, or active-active relationships by using the CLI.....	42
Switching Metro Mirror or Global Mirror relationships using the CLI.....	43
Deleting Metro Mirror, Global Mirror, or active-active relationships by using the CLI.....	44
Creating Metro Mirror, Global Mirror, or active-active consistency groups by using the CLI.....	44
Modifying Metro Mirror, Global Mirror, or active-active consistency groups by using the CLI.....	44
Starting and stopping Metro Mirror, Global Mirror, or active-active consistency-group copy processes by using the CLI.....	45
Deleting Metro Mirror, Global Mirror, or active-active consistency groups by using the CLI.....	46
Creating Metro Mirror and Global Mirror partnerships by using the CLI.....	47
Modifying Metro Mirror and Global Mirror partnerships using the CLI.....	48
Starting and stopping Metro Mirror and Global Mirror partnerships using the CLI.....	48
Deleting Metro Mirror and Global Mirror partnerships using the CLI.....	49
Determining the WWNNs of a node using the CLI.....	49
Listing node-dependent volumes using the CLI.....	50
Determining the volume name from the device identifier on the host.....	51
Determining the host that a volume maps.....	52
Determining the relationship between volume and MDisks using the CLI.....	52
Determining the relationship between MDisks and controller LUNs using the CLI.....	53
Increasing the size of your system by using the CLI.....	53
Adding a node or enclosure to increase the size of the system.....	53
Validating and repairing mirrored volume copies by using the CLI.....	56
Repairing a thin-provisioned volume using the CLI.....	57
Recovering offline volumes by using the CLI.....	58
Recovering a node and returning it to the system by using the CLI.....	58
Recovering offline volumes using the CLI.....	59
Moving offline volumes to their original I/O group using the CLI.....	60
Recording WWPN changes of replaced host HBAs.....	60
Expanding volumes by using the CLI.....	61
Expanding a volume that is mapped to an AIX host.....	62
Expanding a volume that is mapped to a Microsoft Windows host by using the CLI.....	63
Shrinking a volume using the CLI.....	63
Migrating extents using the CLI.....	64
Migrating volumes between pools using the CLI.....	65
Moving a volume between I/O groups using the CLI.....	67
Creating an image-mode volume using the CLI.....	68
Migrating data to an image mode volume using the CLI.....	69
Deleting a node from a system by using the CLI.....	69
Completing the system maintenance procedure by using the CLI.....	71
Modifying system IP addresses using the CLI.....	71
Changing the system gateway address by using the CLI.....	72
Changing the relationship bandwidth for a system by using the CLI.....	73
Configuring the system for iSCSI or iSER hosts.....	73

Configuring or modifying an iSCSI alias by using the CLI.....	75
Configuring the iSNS server address by using the CLI.....	76
Configuring system iSCSI or iSER authentication by using the CLI.....	76
Configuring remote authentication service using the CLI.....	77
Configuring remote authentication service with Lightweight Directory Access Protocol (LDAP) by using the CLI.....	77
Changing user groups	79
Changing users.....	79
Managing SNMP notifications.....	80
Setting up syslog notifications.....	82
Setting up call home with email notifications.....	83
Setting up email servers by using the CLI.....	85
Changing user passwords using the CLI.....	86
Changing the locale setting using the CLI.....	86
Viewing the feature log using the CLI.....	86
Analyzing the error log using the CLI.....	87
Shutting down a system by using the CLI.....	87
Updating the system automatically using the CLI.....	88
Chapter 3. Array commands.....	91
charray.....	91
charraymember.....	94
expandarray.....	98
lsarray.....	101
lsarrayexpansionprogress.....	111
lsarrayinitprogress.....	114
lsarraylba.....	117
lsarraymember.....	120
lsarraymembergoals.....	124
lsarraymemberprogress.....	128

About this guide

This publication provides information that helps you configure and use the IBM Spectrum Virtualize for SAN Volume Controller and Storwize® Family.

Who should use this guide

This guide is intended for system administrators or others who install and use the SAN Volume Controller or Storwize V7000.

Before you use the SAN Volume Controller, you should have an understanding of storage area networks (SANs), the storage requirements of your enterprise, and the capabilities of your storage units.

Accessibility

IBM strives to provide products with usable access for everyone, regardless of age or ability.

This product uses standard Windows navigation keys.

For more information, see the accessibility features topic in the "Reference" section.

Emphasis

Different typefaces are used in this guide to show emphasis.

The following typefaces are used to show emphasis.

Emphasis	Meaning
Boldface	Text in boldface represents menu items.
Bold monospace	Text in bold monospace represents command names.
<i>Italics</i>	Text in <i>italics</i> is used to emphasize a word. In command syntax, it is used for variables for which you supply actual values, such as a default directory or the name of a system.
Monospace	Text in monospace identifies the data or commands that you type, samples of command output, examples of program code or messages from the system, or names of command flags, parameters, arguments, and name-value pairs.

Publications and related libraries

Product manuals, other publications, and websites that contain information that is related to your system are available.

IBM Knowledge Center for SAN Volume Controller

The information collection in the IBM Knowledge Center contains all of the information that is required to install, configure, and manage the system. The information collection in the IBM Knowledge Center is updated between product releases to provide the most current documentation. The information collection is available at the following website:

[Knowledge Center](#)

SAN Volume Controller library

IBM websites for help, services, and information

Table 1 on page xxiv lists websites where you can find help, services, and more information.

Table 1. IBM websites for help, services, and information

Publications in the IBM Knowledge Center

Each PDF publication in the library is available in the IBM Knowledge Center by clicking the title in the "Link to PDF" column:

Table 2. SAN Volume Controller library		
Title	Description	Link to PDF file
<i>IBM SAN Volume Controller Model SA2 and Model SV2 Quick Start Guide</i>	Hardware Installation Guide [PDF]	Command-Line Interface User's Guide [PDF]
<i>IBM Spectrum Virtualize Software Command-Line Interface User's Guide</i> <i>For IBM Spectrum Virtualize as Software Only, IBM Spectrum Virtualize for Public Cloud, IBM SAN Volume Controller, IBM Storwize V7000, IBM Storwize V5000, IBM Storwize V5000E, IBM Storwize V5100, IBM FlashSystem 5000, IBM FlashSystem 5100, IBM FlashSystem 7200, IBM FlashSystem V9000, IBM FlashSystem 9100, and IBM FlashSystem 9200</i>	The guide describes the commands that you can use from the SAN Volume Controller command-line interface (CLI).	

Related accessibility information

To view a PDF file, you need Adobe Reader, which can be downloaded from the Adobe website:

www.adobe.com/support/downloads/main.html

Sending comments

Your feedback is important in helping to provide the most accurate and highest quality information.

Procedure

To submit any comments about this publication or any other IBM storage product documentation:

- Send your comments by email to ibmkc@us.ibm.com. Be sure to include the following information:

- Exact publication title and version
- Page, table, or illustration numbers that you are commenting on
- A detailed description of any information that should be changed

Syntax diagrams

A syntax diagram uses symbols to represent the elements of a command and to specify the rules for using these elements.

Table 3 on page xxv explains how to read the syntax diagrams that represent the command-line interface (CLI) commands. In doing so, it defines the symbols that represent the CLI command elements.

Table 3. Syntax diagrams		
Element	Syntax	Description
Main path line	>>><>() ()	The main path line begins on the left with double arrowheads: >>. The main path line ends on the right with two arrowheads facing each other: <>. If a diagram is longer than one line, each line to be continued ends with a single arrowhead and the next line begins with a single arrowhead: > Read the diagrams from left-to-right, top-to-bottom, following the main path line.
Keyword	➤ <i>esscli</i> ➤	Represents the name of a command, flag, parameter, or argument. A keyword is not in italics. Spell a keyword exactly as it is shown in the syntax diagram.
Required keywords		Indicate the parameters or arguments that you must specify for the command. Required keywords must be written on the main path line. Required keywords that cannot be used together are stacked vertically.
Optional keywords		Indicate the parameters or arguments that you can choose to specify for the command. Optional keywords must be written below the main path line. Mutually exclusive optional keywords are stacked vertically.
Default value		The default value must be written above the main path line.

Table 3. Syntax diagrams (continued)		
Element	Syntax	Description
Repeatable keyword or value		Represents a parameter or argument that you can specify more than once. A repeatable keyword or value is represented by an arrow returning to the left above the keyword or value.
Variable		Represents the value that you need to supply for a parameter or argument, such as a file name, user name, or password. Variables are in italics.
Space separator		Adds a blank space on the main path line to separate keywords, parameters, arguments, or variables from each other.
Quotation mark delimiters		Indicates the start and end of a parameter or argument that contains multiple values. Enclose one or more name-value pairs in a set of double quotation marks for a particular parameter or argument. If the value of a parameter or name-value pair contains a blank or white space, enclose the entire value in a set of single quotation marks.
Equalsign operator		Separates a name from its value in a name-value pair.
Syntax fragment		Breaks up syntax diagrams that are too long, too complex, or repetitious. The fragment name is inserted in the main diagram, and the actual fragment is shown below the main diagram.

Terminology

Terms that are most commonly used for the command-line interface (CLI) operations.

Table 4 on page xxvi shows the terms and offers a brief description.

Table 4. Abbreviations	
Name	Object type
Host	Refers to a single host.
Host cluster	Refers to a host cluster (which is part of a server that shares a set of volumes).
Host object	Refers to a list of worldwide port names WWPNs and iSCSI names.
Volume copy	Referred to as vdiskcopy.

<i>Table 4. Abbreviations (continued)</i>	
Name	Object type
Thin-provisioned volume copy	Referred to as <code>sevdiskcopy</code> .
Managed disk (MDisk)	Referred to as <code>MDisk</code> .
MDisk group or storage pool	Referred to as <code>storage pool</code> .
I/O group	Referred to as <code>iogrp</code> .
Node, node canister, enclosure	Refers to node or node canister or enclosure, depending on the system.
System or cluster	Referred to as <code>system</code> .
VDisk or volume	Referred to as <code>volume</code> .
Controller	Refers to a controller that is part of a clustered system.
IBM FlashCopy® mapping	Referred to as <code>fcmap</code> .
IBM FlashCopy consistency group	Referred to as <code>fcconsistgrp</code> .
Metro Mirror or Global Mirror relationship	Referred to as <code>rcrelationship</code> .
Metro Mirror or Global Mirror consistency group	Referred to as <code>rcconsistgrp</code> .
HyperSwap® mirroring consistency group	Referred to as <code>hyperswap</code> .
Unsupported/unknown object	unknown

CLI special characters

The following special characters are used in the command-line interface (CLI) command examples.

minus (-) sign

Flags are prefixed with a - (minus) sign. Flags define the action of a command or modify the operation of a command. You can use multiple flags, followed by parameters, when you issue a command. The - character cannot be used as the first character of an object name.

vertical bar (|)

A vertical bar signifies that you choose only one value. For example, [`a` | `b`] in brackets indicates that you can choose `a`, `b`, or nothing. Similarly, { `a` | `b` } in braces indicates that you must choose either `a` or `b`.

delimiters (: or , or !)

Delimiters are used to delimit items listed after issuing an information command.

- Colon (:) is used to delimit items in a list in a command (for example `mkhost -name myhost -hbawwpn AA22000011112222:AA22000011112223`).
- Comma (,) is used to delimit items in a list in a command if item values can contain a colon.
- Exclamation mark (!) is used to delimit items in a command if the item values can contain a colon or comma. Exclamation points generally do not show up in example output and are a good delimiter to use.

Using wildcards in the CLI

You can use wildcards in the system command-line interface (CLI).

The CLI supports the use of the asterisk character (*) as a wildcard within the arguments of certain parameters. There are some behavioral issues that must be considered when using wildcards in order to prevent unexpected results. These behavioral issues and the ways to avoid them are as follows:

1. Running the command while logged onto the node.

The shell will attempt to interpret any of the special characters if they are not escaped (preceded with a backslash character). Wildcards will be expanded into a list of files if any files exist that match the wildcards. If no matching files exist, the wildcard is passed to the system command untouched.

To prevent expansion, issue the following command in one of its formats:

cleardumps -prefix '/dumps/*.txt' with single quotation marks (' '), or

cleardumps -prefix /dumps/*.txt using a backslash (\), or

cleardumps -prefix "/dumps/*.txt" with double quotation marks (" ").

2. Running the command through Secure Shell (SSH), for example from a host.

This method is slightly more complicated because the host shell processes the command line before it is passed through SSH to the shell on the system. This means an extra layer of protection is required around the wildcard as the host shell will strip off any protecting quotes, and if the wildcard is exposed to the system shell, this will result in the wildcard being expanded in the system shell.

To prevent expansion, issue the following command in one of its formats:

cleardumps "'/dumps/*.txt'" with single quotation marks (' ') inside of double quotation marks (" "), or

cleardumps '/dumps/*.txt' using a backslash (\) inside of single quotation marks (' '), or

cleardumps "'/dumps/*.txt'" with double quotation marks (" ") inside of single quotation marks (' ').

Data types and value ranges

The maximum length of any single parameter entered into the command line is 2176 bytes.

Note: When creating a new object, the system assigns a default **-type** name if one is not specified. The default **-type** name consists of the object prefix and the lowest available integer starting from 0 (except for nodes starting from 1); for example, *vdisk23*; the default **-type** name must be unique.

This table lists the data types and the value ranges for each.

Table 5. Data types	
Data types	Value ranges
filename_arg	<p>This is a (optionally fully qualified) file name, containing a maximum of 169 characters. Valid characters are:</p> <ul style="list-style-type: none"> • . (period; the field must not start with, end with, or contain two consecutive periods) • / (forward slash) • - (hyphen) • _ (underscore) • a–z (lowercase letters, A through Z) • A–Z (uppercase letters, A through Z) • 0–9 (numerals 0 through 9)

Table 5. Data types (continued)

Data types	Value ranges
directory_or_file_filter	<p>Specifies a directory, file name filter, or both, within the specified directory. Valid directory values are:</p> <ul style="list-style-type: none"> • /dumps • /dumps/audit • /dumps/configs • /dumps/elogs • /dumps/feature • /dumps/iostats • /dumps/iotrace • /dumps/software <p>The file name filter can be any valid file name, containing a maximum of 128 characters, with or without the "*" (wildcard), and appended to the end of a directory value. Valid characters are:</p> <ul style="list-style-type: none"> • * (asterisk/wildcard) • . (the field must not start with, end with, or contain two consecutive periods) • / • - • _ • a-z • A-Z • 0-9
filename_prefix	<p>The prefix of a file name, containing a maximum of 128 characters. Valid characters are:</p> <ul style="list-style-type: none"> • - • _ • a-z • A-Z • 0-9

Table 5. Data types (continued)	
Data types	Value ranges
name_arg	<p>Names can be specified or changed using the create and modify functions. The view commands provide the name and ID of an object.</p> <p>Note: The system name is set when the system is created.</p> <p>The first character of a <i>name_arg</i> must be nonnumeric. The first character of an object name cannot be a – (dash) because the CLI (command-line interface) interprets it as being the next parameter.</p> <p>Valid characters are:</p> <ul style="list-style-type: none"> • . (a period - the field must not start with, end with, or contain two consecutive periods) • / • - • _ • space • a through z • A through Z • 0 through 9
password	This is a user-defined password containing 6 - 64 printable ASCII characters.
serial_number	<p>The format of this number conforms to IBM standard C-S 1-1121-018 1999-06 Serial Numbering for IBM products. The serial number is 7 digits, the first two of which define the manufacturing location, leaving 5 digits for the product.</p> <p>The standard defines a way to extend the serial number using letters in the place of numbers in the 5-digit field.</p>
ip_address_arg	<p>The argument follows the standard rules for dotted decimal notation.</p> <p>The following Internet Protocol 4 (IPv4) and Internet Protocol 6 (IPv6) address formats are supported:</p> <p>IPv4 (no port set, SAN Volume Controller uses default) 1.2.3.4</p> <p>IPv4 with specific port 1.2.3.4:22</p> <p>Full IPv6, default port 1234:1234:0001:0123:1234:1234:1234:1234</p> <p>Full IPv6, default port, leading zeros suppressed 1234:1234:1:123:1234:1234:1234:1234</p> <p>Full IPv6 with port [2002:914:fc12:848:209:6bff:fe8c:4ff6]:23</p> <p>Zero-compressed IPv6, default port 2002::4ff6</p> <p>Zero-compressed IPv6 with port [2002::4ff6]:23</p>
dns_name	This is the dotted domain name for the system subnet (for example, yourcompany.com).

Table 5. Data types (continued)	
Data types	Value ranges
hostname	<p>The host name assigned to the system. This name can be different from the system name, and is modifiable.</p> <p>A combination of the host name and the <i>dns_name</i> is used to access the system, for example: https://hostname.yourcompany.com</p>
capacity_value	<p>The capacity expressed within a range of 512 bytes to 2 petabytes (PB).</p> <p>Tip: Specify the capacity as megabytes (MB), kilobytes (KB), gigabytes (GB), or PB. When using MB, specify the value in multiples of 512 bytes. A capacity of 0 is valid for a striped or sequential volume. The smallest number of supported bytes is 512.</p>
node_id	<p>A node ID differs from other IDs in that it is a unique ID assigned when a node is used to create a system, or when a node is added to a system. A <i>node_id</i> value is never reused in a system.</p> <p>Node IDs are internally represented as 64-bit numbers, and like other IDs, cannot be modified by user commands.</p>
xxx_id	<p>All objects are referred to by unique integer IDs, assigned by the system when the objects are created. All IDs are represented internally as 32-bit integers; node IDs are an exception.</p> <p>IDs in the following ranges identify the various types of objects:</p> <ul style="list-style-type: none"> • node_id: A positive decimal integer greater than or equal to 1 • mdisk_grp_id: 0–127 • io_grp_id: 0–3 (See Note.) • mdisk_id: 0–4095 • vdisk_id: 0–8191 • copy_id: 0–1 • host_id: 0–1023 • flash_const_grp_id: 0–255 • remote_const_grp_id: 0–255 • fcmapi_id: 0–4095 • rcrel_id: 0–8191 • controller_id: 0–63 <p>Note: The io_group 4 exists but is used only in certain error recovery procedures. These IDs, like node IDs, cannot be modified by user commands.</p> <p>Note: IDs are assigned at run time by the system and cannot be relied upon to be the same after; for example, the configuration restoration. Use object names in preference to IDs when working with objects.</p>
xxx_list	A colon-delimited list of values of type xxx.
wwpn_arg	<p>The Fibre Channel worldwide port name (WWPN), expressed as a 64-bit hexadecimal number and consisting of the characters 0–9, a–f, and A–F; for example: 1A2B30C67AFFE47B.</p> <p>Note: Entering WWPN 0 in the command string causes a command failure.</p>

Table 5. Data types (continued)	
Data types	Value ranges
panel_name	This is a string of up to six characters corresponding to the number on the printed label below the display on the front panel of a node in the system.
sequence_number	A 32-bit unsigned integer, expressed in decimal format.
csi_num_arg	A 32-bit unsigned integer, expressed in decimal format.
percentage_arg	An 8-bit unsigned integer, expressed in decimal 0–100 format.
extent_arg	A 32-bit unsigned integer, expressed in decimal format.
num_extents_arg	A 32-bit unsigned integer, expressed in decimal format.
threads_arg	An 8-bit unsigned integer, expressed in decimal format. Valid values are 1, 2, 3, or 4.
velocity_arg	The fabric speed in gigabytes per second (GBps). Valid values are 1 or 2.
timezone_arg	The ID as detailed in the output of the lstimezones command.
timeout_arg	The command timeout period. An integer from 0 to 600 (seconds).
stats_time_arg	The frequency at which statistics are gathered. Valid values are 1 to 60 minutes in increments of 1 minute.
directory_arg	<p>Specifies a directory, file name filter, or both, within the specified directory. Valid directory values are:</p> <ul style="list-style-type: none"> • /dumps • /dumps/audit • /dumps/cimom • /dumps/configs • /dumps/elog • /dumps/feature • /dumps/iostats • /dumps/iotrace • /home/admin/upgrade <p>The file name filter can be any valid file name, containing a maximum of 128 characters, with or without the wildcard (*, an asterisk), and appended to the end of a directory value. Valid characters are:</p> <ul style="list-style-type: none"> • * • . (the field must not start with, end with, or contain two consecutive periods) • / • - • _ • a–z • A–Z • 0–9

Table 5. Data types (continued)	
Data types	Value ranges
locale_arg	The system locale setting. Valid values are: <ul style="list-style-type: none"> • 0 en_US: US English (default) • 1 zh_CN: Simplified Chinese • 2 zh_TW: Traditional Chinese • 3 ja_JP: Japanese • 4 fr_FR: French • 5 de_DE: German • 6 it_IT: Italian • 7 es_ES: Spanish
key_arg	A user-defined identifier for a secure shell (SSH) key, containing a maximum of 30 characters.
user_arg	Specifies the user: admin or service.
copy_rate	A numeric value of 0–100.
copy_type	Specifies the Mirror copy type: Metro or Global.

The maximum number of values entered into a colon-separated list is 128; exceeding this maximum number returns an error.

CLI commands and parameters

Command-line interface (CLI) commands and parameters are represented in the syntax diagram.

The system command-line interface offers command line completion for command entry. Command line completion allows you to type in the first few characters of a command and press the Tab key to fill in the rest of the command name. If there are multiple commands that start with the same characters, then a list of possible commands is returned. You can type in more characters until the command name is unambiguous.

CLI parameters can be entered in any order except in the following situations:

- When a command name is specified, the first argument given must be the action that you want to be performed.
- Where you are specifying a command against a specific object, the object ID or name must be the last argument in the line.

A valid parameter meets the following requirements:

- Parameters can be entered in any order.
- If a parameter has an associated argument, the argument must always follow the parameter.
- A parameter must start with a '-'; otherwise, it is assumed to be an argument.
- The maximum length of any single parameter that can be entered into the CLI is 128 bytes.
- An argument can contain multiple data items. The maximum number of data items that you can enter into such a list is 128. For a component list, separate the individual items by a colon.
- Any parameter with an argument can be entered as -parameter=argument.
- Entering -param= means the argument is an empty string, equivalent to -param.
- The symbol '--' is valid as the next to last entry on the command line. It specifies that the next entry is the target object name or ID, even if it begins with a hyphen.

```
chuser -usergrp=-usergrp -- -password
```

- The symbol '--' is valid as the final word on the command line.

Examples that are valid

```
mkuser -name fred -usergrp 0 -password 'buckets'
mkuser -name fred -usergrp 0 -password='buckets'
mkuser -name=-barney -usergrp=0 -password='buckets'

chuser -usergrp 1 fred
chuser -usergrp 1 -- fred
chuser -usergrp 1 -- -barney
```

Examples that are invalid

```
chuser -usergrp 1 fred --
chuser -usergrp 1 -- fred --
chuser -- -usergrp 1 fred
chuser -usergrp 1 -barney
```

CLI flags

The following flags are common to all command-line interface (CLI) commands.

-? or -h

Print help text. For example, issuing **lssystem -h** provides a list of the actions available with the **lssystem** command.

-nomsg

When used, this flag prevents the display of the successfully created output. For example, if you issue the following command:

```
mkmdiskgrp -ext 16
```

it displays:

```
MDisk Group, id [6], successfully created
```

However, if the -nomsg parameter is added, for example:

```
mkmdiskgrp -ext 16 -nomsg
```

the following information is displayed:

```
6
```

This parameter can be entered for any command, but is only acted upon by those commands that generate the successfully created outputs. All other commands ignore this parameter.

CLI messages

Ensure that you are familiar with the command-line interface (CLI) messages.

When some commands complete successfully, textual output is normally provided. However, some commands do not provide any output. The phrase No feedback is used to indicate that no output is provided. If the command does not complete successfully, an error is generated. For example, if the command has failed as a result of the cluster being unstable, the following output is provided:

- CMMVC5786E The action failed because the cluster is not in a stable state.

CLI deprecated and discontinued commands

Some command-line interface (CLI) commands are discontinued or deprecated and replaced with new commands.

Command-line interface (CLI) commands can be discontinued or deprecated and replaced with new commands that are more effective. This action can affect scripting, which is done to simplify tasks such as specifying (repeated) commands.

A discontinued command is removed from the CLI and can no longer be used. In most instances, there is a replacement command for discontinued commands.

A deprecated command can still be used if the appropriate command prefix is specified (`svctask` or `svcinfo`, for example). In most instances, there is a replacement command for deprecated commands.

The following commands are deprecated:

- These commands are replaced by **lseventlog**:
 - **caterrlog**
 - **caterrlogbyseqnum**
 - **lserrlogbyfcconsistgrp**
 - **lserrlogbyfcmap**
 - **lserrlogbyhost**
 - **lserrlogbyiogrp**
 - **lserrlogbymdisk**
 - **lserrlogbymdiskgrp**
 - **lserrlogbynode**
 - **lserrlogbyrcconsistgrp**
 - **lserrlogbyrcrelationship**
 - **lserrlogbyvdisk**
- These commands are replaced by **lsdumps**:
 - **ls2145dumps**
 - **lsauditlogdumps**
 - **lserrlogdumps**
 - **lscimomdumps**
 - **lsfeaturedumps**
 - **lsiostatsdumps**
 - **lsiotracedumps**
 - **lsmdiskdumps**
 - **lssoftwaredumps**
- **lssoftwareupgradestatus** is replaced by **lsupdate**
- **chenclosurevpd** is replaced by **chvpd**
- **cherrstate** is replaced by **cheventlog**
- **lsnodedependentvdisks** is replaced by **lsdependentvdisks**
- **setquorum** is replaced by **chquorum**
- **mkpartnership** is replaced by **mkippartnership** and **mkfcpartnership**
- **lshbaportcandidate** is replaced by **lssasportcandidate** and **lsfcportcandidate**

The following commands are discontinued:

- These commands are replaced by **lsdumps**:
 - **svcservicemodeinfo ls2145dumps**
 - **svcservicemodeinfo lsclustervpd**
 - **svcservicemodeinfo lserrlogdumps**
 - **svcservicemodeinfo lsfeaturedumps**
 - **svcservicemodeinfo lsiostatsdumps**
 - **svcservicemodeinfo lsiotracedumps**

- **svcservicemodeinfo lsmdiskdumps**
- **svcservicemodeinfo lssoftwaredumps**
- These commands are replaced by the **user management** commands:
 - **addsshkeys**
 - **lsauth**
 - **mkauth**
 - **rmsshkey**
 - **rmailsshkeys**
 - **rmauth**
- **applydisksoftware** is replaced by **applydrivesoftware**
- **chcluster** is replaced by **chsystem**
- **cpfabricdumps** has no replacement
- **dumpconfig** has no replacement
- **dumpinternallog** has no replacement
- **lscluster** is replaced by **lssystem**
- **lsclustercandidate** is replaced by **lspartnershipcandidate**
- **lsclusterip** is replaced by **lssystem**
- **lsclusterstats** is replaced by **lssystemstats**
- **lsconfigdumps** has no replacement
- **recoverarraybycluster** is replaced by **recoverarraybysystem**
- **recoverdiskbycluster** is replaced by **recoverdiskbysystem**
- **svcservicemodeinfo lsclustervpd** is replaced by **satask lsservicestatus**
- **svcservicemodetask applysoftware** is replaced by **satask installsoftware**
- **svcservicemodetask cleardumps** is replaced by **cleardumps**
- **svcservicemodetask dumperrlog** is replaced by **dumperrlog**
- **svcservicemodetask exit** is replaced by **stopservice**
- **setclustertime** is replaced by **setsystemtime**
- **stopcluster** is replaced by **stopsystem**
- **triggermdiskdump** is replaced by **triggerdrivedump**
- **setevent** is replaced by **chsnmpserver**, **lssnmpserver**, **mksnmpserver**, and **rmsnmpserver**
- **setemail** is replaced by **chemail**, **chemailserver**, **lsemailserver**, **mkemailserver**, and **rmemailserver**

Understanding capacity indicators

The system uses base-2 (binary numeral) as capacity indicators for volumes, drives, and other system objects. The management GUI and the command-line interface (CLI) use different abbreviations to indicate capacity.

The following table displays the differences in how capacity indicators are displayed in the management GUI and the CLI.

<i>Table 6. Capacity indicators.</i> This table displays the differences in how capacity indicators are displayed in the management GUI and the CLI.			
Metric	GUI Abbreviation	CLI Abbreviation	Value
kibibyte	KiB	KB	1024
mebibyte	MiB	MB	1,048,576

Table 6. Capacity indicators. This table displays the differences in how capacity indicators are displayed in the management GUI and the CLI. *(continued)*

Metric	GUI Abbreviation	CLI Abbreviation	Value
gibibyte	GiB	GB	1,073,741,824
tebibyte	TiB	TB	1,099,511,627,776
pebibyte	PiB	PB	1,125,899,906,842,624
exbibyte	EiB	EB	1,152,921,504,606,846,976
zebibyte	ZiB	ZB	1,180,591,620,717,411,303,424
yobibyte	YiB	YB	1,208,925,819,614,629,174,706,176

Attributes of the **-filtervalue** parameters

The **-filtervalue** parameter filters a view that is based on specific attribute values that relate to each object type. You can combine multiple filters to create specific searches, for example, **-filtervalue name=fred:status=online**. The help (**-filtervalue**) specifies the attributes that are available for each object type.

The **-filtervalue** parameter must be specified with *attrib=value*. The **-filtervalue?** and **-filtervalue** parameters cannot be specified together.

Note: The qualifier characters less than (<) and greater than (>) must be enclosed within double quotation marks (" "). For example, **-filtervalue vdisk_count "<"4 or port_count ">"1**. It is also valid to include the entire expression within double quotation marks. For example, **-filtervalue "vdisk_count<4"**.

When an attribute requires the **-unit** parameter, it is specified after the attribute. For example, **-filtervalue capacity=24 -unit mb**. The following input options are valid for the **-unit** parameter:

- b (bytes)
- kb (Kilobytes)
- mb (Megabytes)
- gb (Gigabytes)
- tb (Terabytes)
- pb (Petabytes)

Capacity values displayed in units other than bytes might be rounded. When filtering on capacity, use a unit of bytes, **-unit b**, for exact filtering.

You can use the asterisk (*) character as a wildcard character when names are used. The asterisk character can be used either at the beginning or the end of a text string, but not both. Only one asterisk character can be used in a **-filtervalue** parameter.

Chapter 1. Setting up an SSH client

Secure Shell (SSH) is a client/server network application. It is used as a communication vehicle between the host system (for example, a laptop computer) and the system command-line interface (CLI).

Overview

The system acts as the SSH server in this relationship. The SSH client provides a secure environment in which to connect to a remote computer. Authentication is completed by using a user name and password. If you require command-line access without entering a password, it uses the principles of public and private keys for authentication.

Authenticating SSH logins

Generate a Secure Shell (SSH) key pair to use the command-line interface (CLI). Additionally, when you use the SSH to log in to the system, you must use the RSA-based private key authentication.

When you are using AIX® hosts, SSH logins are authenticated on the system by using the RSA-based authentication that is supported in the OpenSSH client that is available for AIX. This scheme is based on the supplied password (or if you require command-line access without entering a password, then public-key cryptography is used) by using an algorithm that is known commonly as RSA.

Note: The authentication process for host systems that are not AIX is similar.

With this scheme (as in similar OpenSSH systems on other host types), the encryption, and decryption is done by using separate keys. This scheme means that it is not possible to derive the decryption key from the encryption key.

Because physical possession of the private key allows access to the system, the private key must be kept in a protected place, such as the .ssh directory on the AIX host, with restricted access permissions.

When SSH client (A) attempts to connect to SSH server (B), the SSH password (if you require command-line access without entering a password, the key pair) authenticates the connection. The key consists of two halves: the public keys and private keys. The SSH client public key is put onto SSH Server (B) using some means outside of the SSH session. When SSH client (A) tries to connect, the private key on SSH client (A) is able to authenticate with its public half on SSH server (B).

The system supports up to 32 interactive SSH sessions on the management IP address simultaneously.

Note: After one hour, a fixed SSH interactive session times out, which means the SSH session is automatically closed. This session timeout limit is not configurable.

To connect to the system, the SSH client requires a user login name and an SSH password (or if you require command-line access without entering a password, the key pair). Authenticate to the system by using a management user name and password. When you use an SSH client to access a system, you must use your `SVC_username` and password. The system uses the password (and if not a password, the SSH key pair) to authorize the user who is accessing the system.

You can connect to the system by using the same user name with which you log in to the system.

For Microsoft Windows hosts, PuTTY can be downloaded from the internet and used at no charge to provide an SSH client.

Microsoft Windows 10 includes the OpenSSH client. The **ssh** and **scp** commands work on the Microsoft Windows 10 command line. Use your existing private key or generate a new SSH keypair, and then place the private key in the .ssh folder in your user folder.

You can connect to the system by using the same user name with which you log in to the system.

Setting up an SSH client on a Windows host

You can prepare the SSH client on a Windows host.

The workstation for the system include the PuTTY client program, which is a Microsoft Windows SSH client program. The PuTTY client program can be installed on your workstation in one of these ways:

- If you purchased the workstation hardware option from IBM, the PuTTY client program has been preinstalled on the hardware.
- You can use the workstation software installation CD to install the PuTTY client program.
- You can use the separate PuTTY client program-installation wizard, `putty-version-installer.exe`. You can download the PuTTY client program from this website:

[Download Putty](#)

Note: Before you install the PuTTY client program, ensure that your Windows system meets the system requirements.

You can connect to the system by using the same user name with which you log in to the system.

Generating an SSH key pair using PuTTY

To use the system command-line interface, you must generate a Secure Shell (SSH) key pair using PuTTY.

About this task

Generate SSH keys using the PuTTY key generator (PuTTYgen):

Procedure

1. Start PuTTYgen by clicking **Start > Programs > PuTTY > PuTTYgen**. The PuTTY Key Generator panel is displayed.
2. Click **SSH-2 RSA** as the type of key to generate.

Note: Leave the number of bits in a generated key value at 1024.

3. Click **Generate** and then move the cursor around the blank area of the Key section to generate the random characters that create a unique key.

When the key has been completely generated, the information about the new key is displayed in the Key section.

Attention: Do not modify the Key fingerprint or the Key comment fields; this can cause your key to no longer be valid.

4. Optional: Enter a passphrase in the **Key passphrase** and **Confirm passphrase** fields. The passphrase encrypts the key on the disk; therefore, it is not possible to use the key without first entering the passphrase.
5. Save the public key by:
 - a) Click **Save public key**. You are prompted for the name and location of the public key.
 - b) Type `icat.pub` as the name of the public key and specify the location where you want to save the public key.
For example, you can create a directory on your computer called *keys* to store both the public and private keys.
 - c) Click **Save**.
6. Save the private key by:
 - a) Click **Save private key**. The PuTTYgen Warning panel is displayed.
 - b) Click **Yes** to save the private key without a passphrase.
 - c) Type `icat` as the name of the private key, and specify the location where you want to save the private key.

For example, you can create a directory on your computer called *keys* to store both the public and private keys. It is recommended that you save your public and private keys in the same location.

d) Click **Save**.

7. Close the PuTTY Key Generator window.

Configuring a PuTTY session for the CLI

You must configure a PuTTY session using the Secure Shell (SSH) password. If you require command line access without entering a password, use the SSH key pair that you created for the command-line interface (CLI).

About this task

Attention: Do not run scripts that create child processes that run in the background and call system commands. This can cause the system to lose access to data and cause data to be lost.

Complete the following steps to configure a PuTTY session for the CLI:

Procedure

1. Select **Start > Programs > PuTTY > PuTTY**. The PuTTY Configuration window opens.
2. Click **Session** in the Category navigation tree. The Basic options for your PuTTY session are displayed.
3. Click **SSH** as the Protocol option.
4. Click **Only on clean exit** as the Close window on exit option. This ensures that connection errors are displayed.
5. Click **Connection > SSH** in the Category navigation tree. The options controlling SSH connections are displayed.
6. Click **2** as the Preferred SSH protocol version.
7. Click **Connection > SSH > Auth** in the Category navigation tree. The Options controller SSH authentication are displayed.
8. Click **Browse** or type the fully qualified file name and location of the SSH client and password. If no password is used, the private key in the **Private key file for authentication** field.
9. Click **Connection > Data** in the Category navigation tree.
10. Type the user name that you want to use on the system in the **Auto-login username** field.
11. Click **Session** in the Category navigation tree. The Basic options for your PuTTY session are displayed.
12. In the **Host Name (or IP Address)** field, type the name or Internet Protocol (IP) address of one of the system IP addresses or host names.
13. Type 22 in the **Port** field. The system uses the standard SSH port.
14. Type the name that you want to use to associate with this session in the **Saved Sessions** field. For example, you can name the session "System 1".
15. Click **Save**.

Results

You have now configured a PuTTY session for the CLI.

Note: If you configured more than one IP address for the system, repeat the previous steps to create another saved session for the second IP address. This can then be used if the first IP address is unavailable.

Connecting to the CLI using PuTTY

Ensure that you are familiar with how to run the PuTTY and plink utilities.

Note: Windows users can download PuTTY from the following website: [Download Putty](#).

The Secure Shell (SSH) protocol specifies that the first access to a new host server sends a challenge to the SSH user to accept the SSH server public key or user password. Because this is the first time that you connect to an SSH server, the server is not included in the SSH client list of known hosts. Therefore, there is a fingerprint challenge, which asks if you accept the responsibility of connecting with this host. If you type *y*, the host fingerprint and IP address are saved by the SSH client.

When you use PuTTY, you must also type *y* to accept this host fingerprint. However, the host fingerprint and IP address are stored in the registry for the user name that is logged on to Windows.

The SSH protocol also specifies that once the SSH server public key is accepted, another challenge is presented if the fingerprint of an SSH server changes from the one previously accepted. In this case, you must decide whether you want to accept this changed host fingerprint.

Note: The SSH server keys on the SAN Volume Controller are regenerated when a microcode load is performed on the clustered system. As a result, a challenge is sent because the fingerprint of the SSH server has changed.

All command-line interface (CLI) commands are run in an SSH session. You can run the commands in one of the following modes:

- An interactive prompt mode
- A single-line command mode, which is entered one time to include all parameters.

Interactive mode

For interactive mode, you can use the PuTTY executable to open the SSH restricted shell.

The system supports up to 32 interactive SSH sessions on the management IP address simultaneously.

Note: After one hour, a fixed SSH interactive session times out, which means the SSH session is automatically closed. This session timeout limit is not configurable.

The following is an example of the command that you can issue to start interactive mode:

```
C:\support_utils\putty <username>@svccconsoleip
```

where `support_utils\putty` is the location of your `putty.exe` file, `<username>` is the IP address of your management GUI, and `<username>` is the user name that you want to use.

If you were to issue the **lsuser** command, which lists the SSH client public keys that are stored on the system, the following output is displayed when `ssh_key=yes`:

```
IBM_2145:cluster0:superuser>lsuser
id name      password ssh_key remote usergrp_id usergrp_name
0  superuser yes      yes    no      0      SecurityAdmin
1  smith     no       yes    no      4      Monitor
2  jones     no       yes    no      2      CopyOperator
```

You can type `exit` and press **Enter** to escape the interactive mode command.

The following is an example of the host fingerprint challenge when using `plink` in interactive mode:

```
C:\Program Files\IBM\svccconsole\cimom>plink superuser@9.43.225.208
The server's host key is not cached in the registry. You
have no guarantee that the server is the computer you
think it is.
The server's key fingerprint is:
ssh-rsa 1024 e4:c9:51:50:61:63:e9:cd:73:2a:60:6b:f0:be:25:bf
If you trust this host, enter "y" to add the key to
PuTTY's cache and carry on connecting.
If you want to carry on connecting just once, without
adding the key to the cache, enter "n".
If you do not trust this host, press Return to abandon the
connection.
Store key in cache? (y/n) y
Using user name "superuser".
Authenticating with public key "imported-openssh-key"
IBM_2145:your_cluster_name:superuser>
```

Single-line command

For single-line command mode, you can type the following all on one command line:

```
C:\Program Files\IBM\svconconsole\cimom>
  plink superuser@9.43.225.208 lsuser
Authenticating with public key "imported-openssh-key"
id name      password ssh_key remote usergrp_id usergrp_name
0  superuser yes      yes      no      0      SecurityAdmin
1  smith     no       yes      no      4      Monitor
2  jones     no       yes      no      2      CopyOperator
```

Note: If you are submitting a CLI command with all parameters in single-line command mode, you are challenged upon first appearance of the SSH server host fingerprint. Ensure that the SSH server host fingerprint is accepted before you submit a batch script file.

The following is an example of the host fingerprint challenge when using plink in single-line command mode:

```
C:\Program Files\IBM\svconconsole\cimom>
  plink superuser@9.43.225.208 lsuser
The server's host key is not cached in the registry. You
have no guarantee that the server is the computer you
think it is.
The server's key fingerprint is:
ssh-rsa 1024 e4:c9:51:50:61:63:e9:cd:73:2a:60:6b:f0:be:25:bf
If you trust this host, enter "y" to add the key to
PuTTY's cache and carry on connecting.
If you want to carry on connecting just once, without
adding the key to the cache, enter "n".
If you do not trust this host, press Return to abandon the
connection.
Store key in cache? (y/n) y
Authenticating with public key "imported-openssh-key"
id name      password ssh_key remote usergrp_id usergrp_name
0  superuser yes      yes      no      0      SecurityAdmin
1  smith     no       yes      no      4      Monitor
2  jones     no       yes      no      2      CopyOperator
```

Starting a PuTTY session for the CLI

You must start a PuTTY session to connect to the command-line interface (CLI).

Before you begin

This task assumes that you have already configured and saved a PuTTY session using the Secure Shell (SSH) password. If you require command line access without entering a password, use the SSH key pair that you created for the CLI.

About this task

Start a PuTTY session:

Procedure

1. Select **Start > Programs > PuTTY > PuTTY**. The PuTTY Configuration window opens.
2. Select the name of your saved PuTTY session and click **Load**.
3. Click **Open**.

Note: If this is the first time that the PuTTY application is being used since you generated and uploaded the SSH password or key pair, a PuTTY Security Alert window is displayed. Click **Yes** to accept the change and trust the new key.

4. Type the *SVC_username* in the **login as** field and press **Enter**.

Preparing the SSH client on an AIX or Linux host

You can prepare the Secure Shell (SSH) client on an AIX or Linux host.

Before you begin

Ensure that you have an SSH client installed on your system:

IBM AIX operating systems

For IBM AIX 5L for POWER, versions 5.1, 5.2, 5.3, and AIX version 6.1 for IBM POWER architecture, you can obtain the OpenSSH client from the bonus packs, but you also must obtain its prerequisite, OpenSSL, from the IBM AIX toolbox for Linux® applications for IBM Power Systems. For AIX 4.3.3, you can obtain the software from the AIX toolbox for Linux applications. You can also obtain the AIX installation images from IBM developerWorks® at the following website:

oss.software.ibm.com/developerworks/projects/openssh

Linux operating systems

The OpenSSH client is installed by default on most Linux distributions. If it is not installed on your system, consult your Linux installation documentation or visit the following website:

www.openssh.org/portable.html

The OpenSSH client can run on a variety of additional operating systems. For more information about the openSSH client, visit the following website:

www.openssh.org/portable.html

About this task

Authentication to the system generally requires the use of a password, but if there is no password you can use a key pair. Use these steps to set up an RSA key pair on the AIX or Linux host and the clustered system:

Results

To authenticate using an SSH key, use the following command:

```
ssh -i full_path_to_key username@my_system
```

Where *my_system* is the name of the system IP, *username@my_system* is the user name that you also log into the system with, and *full_path_to_key* is the full path to the *key* file that was generated in the previous step. Authenticate to the system using a *SVC_username* and password. (If you require command-line access without using a password, SSH keys can be used.) The system determines which user is logging in from the key the user is using.

Note: You can omit `-i full_path_to_key` if you configure the SSH client to use the key file automatically.

If you use the Secure Shell (SSH) to log into the system, use the password defined for accessing the GUI. You can also use RSA-based private key authentication.

For more information, see [“Connecting to the CLI with OpenSSH”](#) on page 7.

Generating an SSH key pair using OpenSSH

You can generate an SSH key pair using OpenSSH.

About this task

Set up an RSA key pair on the AIX or Linux host and the clustered system:

Procedure

1. Create an RSA key pair by issuing a command on the host that is similar to this command:

```
ssh-keygen -t rsa
```

You can also create a valid ECDSA key pair for authentication:

```
ssh-keygen -t ecdsa
```

Tip: Issue the command from the `$HOME/.ssh` directory.

This process generates two user named files. If you select the name `key`, the files are named `key` and `key.pub`. Where `key` is the name of the private key and `key.pub` is the name of the public key.

2. Associate the public key with a user on the clustered system using the management GUI.

Connecting to the CLI with OpenSSH

You can connect to the command-line interface (CLI) with OpenSSH.

To connect to a clustered system by using a `SVC_username` and SSH password, issue the following command:

```
ssh username@my_system
```

To use an SSH key, issue the following command:

```
-i full_path_to_key
```

Where `my_system` is the name of the system IP, `full_path_to_key` is the full path to the generated key file, and `SVC_username` is the user name to connect to the system.

Note: You can omit `-i full_path_to_key` if you configure the SSH client to use the key file automatically. For more information, see the OpenSSH documentation.

Working with local and remote users

You can create either a local or a remote user to access a system.

Before you begin

You can create two categories of users that access the system. These types are based on how the users are authenticated to the system. Local users must provide the `SVC_username` and password, and if you require command line access without entering a password, a Secure Shell (SSH) key - or both. Local users are authenticated through the authentication methods that are located on the system.

If the local user needs access to management GUI, a password is needed for the user. Access to the command-line interface (CLI) is also possible with the same password or (alternatively) a valid SSH key can be used. An SSH password is required if a user is working with both interfaces. User groups define roles that authorize the users within that group to a specific set of operations on the system.

Local users must be part of a user group that is defined on the system.

A remote user is authenticated on a remote service that is provided by an LDAP server and does not need local authentication methods. The remote user does not need to be added to the list of users on the system. If the user requires command-line access without entering a password, the remote user can be added to the system and an SSH key can be specified for the user.

Remote users cannot access the system when the remote service is down. A local user account must be used until the remote service is restored. The user groups a remote user is a member of are defined by the remote authentication service. To define a remote user, create a user group on the local computer that is also defined on the remote authentication service.

You can connect to the system by using the same user name with which you log in to the system.

About this task

Complete these steps to create either a local or remote user:

Procedure

1. Select **Access > Users**.
2. Select the appropriate user group.
3. Click **Create User**.
4. Enter the information on the new user and click **Create**.

UNIX commands available in interactive SSH sessions

You can use several UNIX-based commands while working with interactive SSH sessions.

The system supports up to 32 interactive SSH sessions on the management IP address simultaneously.

Note: After one hour, a fixed SSH interactive session times out, which means the SSH session is automatically closed. This session timeout limit is not configurable.

You can use the following UNIX commands to manage interactive SSH sessions:

Table 7. UNIX commands for interactive SSH sessions	
UNIX commands	Description
grep	Filters output by keywords or expressions.
more	Moves through output one page at a time.
sed	Filters output by complex expressions.
sort	Sorts output according to criteria.
cut	Removes individual columns from output.
head	Displays only first lines.
less	Moves through the output bidirectionally a page at a time. (secure mode)
tail	Shows only the last lines.
uniq	Hides any duplicate information.
tr	Translate characters.
wc	Counts lines and words and characters in data.

Copying the software update files by using PuTTY pscp or openssh scp

PuTTY pscp (or scp) provides a file transfer application for Secure Shell (SSH) to copy files either between two directories on the configuration node or between the configuration node and another host.

Before you begin

Note: PuTTY pscp is useful in systems earlier than Microsoft Windows 10. Windows 10 includes openssh as standard so that scp works in a workstation or power shell window.

To use the pscp application, you must have the appropriate permissions on the source and destination directories on your respective hosts.

About this task

The `pscp` or `scp` application is available when you have an SSH client on your host system. You can access the `pscp` application through a Microsoft Windows command prompt. For Linux and Windows 10 users, the `scp` is part of the `openssh` packages.

Complete these steps to use the `pscp` application. The `scp` process is similar from step “6” on page 9.

Procedure

1. Start a PuTTY session.
2. Configure your PuTTY session to access your system.
3. Save your PuTTY configuration session. For example, you can name your saved session `SVCPUTTY`.
4. Open a command prompt.
5. Issue this command to set the path environment variable to include the PuTTY directory:

```
set path=C:\Program Files\putty;%path%
```

Where `C:\Program Files\putty` is the directory where PuTTY is installed.

6. Issue this command to copy the package onto the node where the CLI runs:

```
pscp -load saved_putty_configuration  
directory_software_upgrade_files/software_upgrade_file_name  
username@cluster_ip_address:/update
```

Where `saved_putty_configuration` is the name of the PuTTY configuration session, `directory_software_upgrade_files` is the location of the software update files, `software_upgrade_file_name` is the name of the software update file, `username` is the name that you want to use on the system, and `cluster_ip_address` is an IP address of your clustered system.

Note: Saving the PuTTY configuration session in step “3” on page 9 and then loading the PuTTY configuration session in step “6” on page 9 is optional. To copy without loading a PuTTY configuration session, use the following syntax:

```
pscp directory_software_upgrade_files/software_upgrade_file_name  
username@cluster_ip_address:/update
```

If there is insufficient space to store the software update file on the system, the copy process fails. In this case, complete the following steps:

- a) Use `pscp` to copy data that you want to preserve from the `/update` directory.
- b) Use the following command to delete dump files in the `/update` directory:

```
cleardumps -prefix /update
```

- c) Repeat step “6” on page 9.

Chapter 2. Using the CLI

The command-line interface (CLI) is a collection of commands that you can use to manage the system.

Overview

The CLI commands use the Secure Shell (SSH) connection between the SSH client software on the host system and the SSH server on the system.

Note: Before you can use the CLI, you must create a system.

To use the CLI from a client system, complete the following steps:

- Install and set up SSH client software on each system that you plan to use to access the CLI.
- Authenticate to the system by using a password.
- Use an SSH public key if you require command line access without entering a password. Then, store the SSH public key for each SSH client on the system.

Note: After the first SSH public key is stored, you can add SSH public keys by using either the management GUI or the CLI.

Use the CLI commands to change or create arrays, drives, enclosures, storage pools, and volumes. You can also use the CLI commands to specify encryption or security settings or work with systems.

For example, use the CLI commands to:

- Set up the system, its nodes, and the I/O groups.
- Set up and maintain canisters and enclosures.
- Analyze error logs event logs (logs).
- Set up and maintain managed disks (MDisk) and storage pools.
- Set up and maintain client public SSH keys on the system.
- Set up and maintain volumes.
- Setup logical host objects.
- Map volumes to hosts.
- Navigate from managed hosts to volumes and MDisks (and the reverse direction up the chain).
- Set up and start Copy Services functions:
 - For FlashCopy and FlashCopy consistency groups
 - For Synchronous Metro Mirror and Metro Mirror consistency groups and relationships
 - For Asynchronous Global Mirror and Global Mirror consistency groups and relationships
 - For active-active consistency groups and relationships
- Setup licensing or featurization settings.

CLI commands generally give feedback whether or not the command ran. Check the audit log or event log (for configuration events, for example) after you specify a command to verify successful completion. You can also check the I/O group of the volume that you change.

Setting the clustered system time by using the CLI

You can use the command-line interface (CLI) to set the system time.

About this task

To set the system time:

Procedure

1. Issue the **showtimezone** CLI command to display the current time-zone settings for the system. The time zone and the associated time-zone ID are displayed.
2. Issue the **listtimezones** CLI command to list the time zones that are available on the system. A list of valid time-zone settings are displayed. Each time zone is assigned an ID. The time zone and the associated ID are indicated in the list.
3. Issue the following CLI command to set the time zone for the system.

```
settimezone -timezone time_zone_setting
```

where 031809142005*time_zone_setting* is the new time zone ID that you chose from the list of time zones that are available on the system.

4. Issue the following CLI command to set the time for the system:

```
setsystemtime -time 031809142005
```

where 031809142005 is the new time that you want to set for the system. You must use the MMDDHHmmYYYY format to set the time for the system.

Setting cluster date and time

You can set the date and time for a system cluster from the System Date and Time Settings panel.

Before you begin

This task assumes that you have already launched the management GUI.

About this task

You can set the System Date and time manually, or by specifying an NTP server:

Procedure

1. Click **Manage Systems > Set System Time** in the portfolio. The System Date and Time Settings panel is displayed.
2. To use NTP to manage the clustered system date and time, enter an Internet Protocol Version 4 (IPv4) address and click **Set NTP Server**.

Note: If you are using a remote authentication service to authenticate users to the system, then both the system and the remote service should use the same NTP server. Consistent time settings between the two systems ensure interactive performance of the management GUI and correct assignments for user roles.

3. To set the clustered system date and time manually, continue with the following steps.
4. Type your changes into the **Date**, **Month**, **Year**, **Hours**, and **Minutes** fields and select a new time zone from the **Time Zone** list.
5. Select **Update cluster time and date**, **Update cluster time zone**, or both.
6. Click **Update** to submit the update request to the clustered system.

Viewing and updating license settings by using the CLI

You can use the command-line interface (CLI) to view and update your license settings.

About this task

Your system provides two license options: Physical Disk Licensing and Capacity Licensing. To view and update your system license settings:

Procedure

1. Issue the **lslicense** CLI command to view the current license settings for the system.
2. Issue the **chlicense** CLI command to change the licensed settings of the system.

Attention:

- License settings are entered when the system is first created; do not update the settings unless you change your license.
- To select Physical Disk Licensing, run the **chlicense** command with one or more of the **physical_disks**, **physical_flash**, and **physical_remote** parameters.
- To select Capacity Licensing, run the **chlicense** command with one or more of the **-flash**, **-remote**, and **-virtualization** parameters. If the physical disks value is nonzero, these parameters cannot be set.

Displaying clustered system properties by using the CLI

You can use the command-line interface (CLI) to display the properties for a system.

About this task

These actions help you display your system property information.

Procedure

Issue the **lssystem** command to display the properties for a system.

The following command is an example of the **lssystem** command you can issue:

```
lssystem -delim : build1
```

where *build1* is the name of the system.

Results

```

Maintaining passwords using the CLI

You can use the command-line interface (CLI) to view and change the status of the password reset feature for the system.

The superuser password can be reset to its default value of **password** by using the technician port on SAN Volume Controller 2145-DH8 nodes or the front panel on earlier models of the system. To meet varying security requirements, this functionality can be enabled or disabled by using the CLI.

Complete the following steps to view and change the status of the password reset function:

1. Issue the **setpwdreset** CLI command to view and change the status of the password reset function for the system.
2. Record the system superuser password because you cannot access the system without it.

The system superuser password can be reset by using a USB key. To meet varying security requirements, this functionality can be enabled or disabled by using the CLI. Complete the following steps to view and change the status of the password reset function:

1. Issue the **setpwdreset** CLI command to view and change the status of the password reset feature for the system.
2. Record the system superuser password because you cannot access the system without it.

Using the dump commands to work with directories

The **lsdumps** command returns a list of dumps in a particular directory.

Dumps are contained in the following directory structure:

- /dumps
- /dumps/audit
- /dumps/cimom
- /dumps/elog
- /dumps/feature
- /dumps/iostats
- /dumps/iotrace
- /dumps/mdisk
- /home/admin/update
- /dumps/drive
- /dumps/enclosure

Use the **lsdumps** command with the optional **prefix** parameter to specify a directory. If you do not specify a directory, /dumps is used as the default. Use the optional *node_id_or_name* parameter to specify the node to list the available dumps. If you do not specify a node, the available dumps on the configuration node are listed.

Use the **cpdumps** command to copy dump files from a nonconfiguration node to the configuration node. You can use this command to retrieve dumps that were saved to an older configuration node. You can retrieve files and put them on the configuration node to be copied.

Use the **cleardumps** command to delete dump directories on a specified node. You can clear specific files or groups of files based on the use of a wildcard (an asterisk, *). You can delete files on a single directory or all of the dump directories (by specifying the /dumps variable).

An audit log tracks the action commands that are issued through an SSH session or from the management GUI. To list a specified number of the most recently audited commands, issue the **catauditlog** command. To dump the contents of the audit log to a file on the current configuration node, issue the **dumpauditlog** command. This command also clears the contents of the audit log.

Dumps contained in the /dumps/cimom directory are created by the CIMOM (Common Information Model Object Manager) that runs on the system. These files are produced during normal operations of the CIMOM.

Dumps that are contained in the /dumps/elog directory are dumps of the contents of the error and event log at the time that the dump was taken. An error or event log dump is created by using the **dumperrlog** command. The command dumps the contents of the error or event log to the /dumps/elog directory. If no file name prefix is supplied, the default *errlog_* is used. The full default file name is *errlog_NNNNNN_YYMMDD_HHMMSS*, where *NNNNNN* is the node front panel name. If the command is used with the **-prefix** parameter, the prefix value is used instead of *errlog*.

Dumps that are contained in the /dumps/iostats directory are dumps of the per-node I/O statistics for disks on the system. An I/O statistics dump is created by using the **startstats** command. As part of this command, you can specify a time interval for the statistics to be written to the file; the default is 15 minutes. Every time the time interval is encountered, the I/O statistics that were collected are written to a

file in the /dumps/iostats directory. The file names that are used for storing I/O statistics dumps are Nm_stats_NNNNNN_YYMMDD_HHMMSS, Nv_stats_NNNNNN_YYMMDD_HHMMSS, Nn_stats_NNNNNN_YYMMDD_HHMMSS, and Nd_stats_NNNNNN_YYMMDD_HHMMSS, where NNNNNN is the node name for the MDisk, volume, node, or drive.

Dumps that are contained in the /dumps/iotrace directory are dumps of I/O trace data. The type of data that is traced depends on the options that are specified by the **settrace** command. The collection of the I/O trace data is started by using the **starttrace** command. The I/O trace data collection is stopped when the **stoptrace** command is used. It is when the trace is stopped that the data is written to the file. The file name is *prefix_NNNNNN_YYMMDD_HHMMSS*, where *prefix* is the value that is entered for the **filename** parameter in the **settrace** command, and NNNNNN is the node name.

Dumps that are contained in the /dumps/mdisk directory are copies of flash drive MDisk internal logs. These dumps are created using the **triggerdrivedump** command. The file name is *mdiskdump_NNNNNN_MMMM_YYMMDD_HHMMSS*, where NNNNNN is the name of the node that contains the MDisk, and MMMM is the decimal ID of the MDisk.

Software update packages are contained in the /home/admin/upgrade directory. These directories exist on every node in the system.

Dumps of support data from a disk drive are contained in the /dumps/drive directory. This data can help to identify problems with the drive, and does not contain any data that applications might have written to the drive.

Dumps from an enclosure or enclosures are contained in the /dumps/enclosure directory.

Dumps that are contained in the /dumps directory result from application abends. Such dumps are written to the /dumps directory. The default file names are *dump.NNNNNN.YYMMDD.HHMMSS*, where NNNNNN is the node front panel name. In addition to the dump file, there might be some trace files written to this directory that are named *NNNNNN.trc*.

Because files can only be copied from the current configuration node (by using secure copy), you can issue the **cpdumps** command to copy the files from a nonconfiguration node to the current configuration node.

Re-adding a repaired node to a clustered system by using the CLI

You can use the command-line interface (CLI) to re-add a failed node back into a clustered system after it was repaired.

Before you begin

Before you add a node to a clustered system, you must make sure that the switchd\ zoning is configured such that the node that is being added is in the same zone as all other nodes in the clustered system. If you are replacing a node and the switch is zoned by worldwide port name (WWPN) rather than by switch port, make sure that the switch is configured such that the node that is being added is in the same VSAN/ zone.

Attention:

1. If you are re-adding a node to the SAN, ensure that you are adding the node to the same I/O group from which it was removed. Failure to select the correct I/O group can result in data corruption. You must use the information that was recorded when the node was originally added to the clustered system. If you do not have access to this information, call the IBM Support Center to add the node back into the clustered system without corrupting the data.
2. The LUNs that are presented to the ports on the new node must be the same as the LUNs that are presented to the nodes that currently exist in the clustered system. You must ensure that the LUNs are the same before you add the new node to the clustered system.
3. LUN masking for each LUN must be identical on all nodes in a clustered system. You must ensure that the LUN masking for each LUN is identical before you add the new node to the clustered system.

4. You must ensure that the model type of the new node is supported by the SAN Volume Controller software level that is installed on the clustered system. If the model type is not supported by the SAN Volume Controller software level, update the clustered system to a software level that supports the model type of the new node. See the following website for the latest supported software levels:

www.ibm.com/support

About this task

Special procedures when you add a node to a clustered system

Applications on the host systems direct I/O operations to file systems or logical volumes that are mapped by the operating system to virtual paths (vpaths), which are pseudo disk objects that are supported by the Subsystem Device Driver (SDD). SDD maintains an association between a vpath and a SAN Volume Controller volume. This association uses an identifier (UID) which is unique to the volume and is never reused. The UID permits SDD to directly associate vpaths with volumes.

SDD operates within a protocol stack that contains disk and Fibre Channel device drivers that are used to communicate with the SAN Volume Controller using the SCSI protocol over Fibre Channel as defined by the ANSI FCS standard. The addressing scheme that is provided by these SCSI and Fibre Channel device drivers uses a combination of a SCSI logical unit number (LUN) and the worldwide node name (WWNN) for the Fibre Channel node and ports.

If an error occurs, the error recovery procedures (ERPs) operate at various tiers in the protocol stack. Some of these ERPs cause I/O to be redriven by using the same WWNN and LUN numbers that were previously used.

SDD does not check the association of the volume with the vpath on every I/O operation that it performs.

Before you add a node to the clustered system, you must check to see if any of the following conditions are true:

- The clustered system has more than one I/O group.
- The node that is being added to the clustered system uses physical node hardware or a slot that has previously been used for a node in the clustered system.
- The node that is being added to the clustered system uses physical node hardware or a slot that has previously been used for a node in another clustered system and both clustered systems have visibility to the same hosts and back-end storage.

If any of the previous conditions are true, the following special procedures apply:

- The node must be added to the same I/O group that it was previously in. You can use the command-line interface (CLI) command **lsnode** or the management GUI to determine the WWN of the clustered system nodes.
- Before you add the node back into the clustered system, you must shut down all of the hosts using the clustered system. The node must then be added before the hosts are rebooted. If the I/O group information is unavailable or it is inconvenient to shut down and reboot all of the hosts by using the clustered system, then do the following:
 - On all of the hosts that are connected to the clustered system, unconfigure the Fibre Channel adapter device driver, the disk device driver, and multipathing driver before you add the node to the clustered system.
 - Add the node to the clustered system, and then reconfigure the Fibre Channel adapter device driver, the disk device driver, and multipathing driver.

Scenarios where the special procedures can apply

The following two scenarios describe situations where the special procedures can apply:

- Four nodes of an eight-node clustered system have been lost because of the failure of a pair of 2145 UPS or four 2145 UPS-1U. In this case, the four nodes must be added back into the clustered system by using the CLI command **addnode** or the management GUI.

Note: You do not need to run the **addnode** command on a node with a partner that is already in a clustered system; the clustered system automatically detects an online candidate.

Note: The **addnode** command is a SAN Volume Controller command. For Storwize V7000, use the **addcontrolenclosure** command.

- A user decides to delete four nodes from the clustered system and add them back into the clustered system using the CLI command **addnode** or the management GUI.

Note: The **addnode** command is a SAN Volume Controller command. For Storwize V7000, use the **addcontrolenclosure** command.

For 5.1.0 nodes, the SAN Volume Controller automatically re-adds nodes that failed back to the clustered system. If the clustered system reports an error for a node missing (error code 1195) and that node has been repaired and restarted, the clustered system automatically re-adds the node back into the clustered system. This process can take up to 20 minutes, so you can manually re-add the node by completing the following steps:

Procedure

1. Issue the **lsnode** CLI command to list the nodes that are currently part of the clustered system and determine the I/O group for which to add the node.

The following is an example of the output that is displayed:

```
lsnode -delim :  
  
id:name:UPS_serial_number:WWNN:status:I0_group_id:I0_group_name  
:config_node:UPS_unique_id:hardware:iscsi_name:iscsi_alias  
:panel_name:enclosure_id:canister_id:enclosure_serial_number  
1:node1::50050868010050B2:online:0:io_grp0:yes::100:iqn.1986-03.com.ibm  
:2145.cluster0.node1::02-1:2:1:123ABCG  
2:node2::50050869010050B2:online:0:io_grp0:no::100:iqn.1986-03.com.ibm  
:2145.cluster0.node2::02-2:2:2:123ABDG
```

Storwize V7000 example:

```
lsnode -delim :  
  
id:name:UPS_serial_number:WWNN:status:I0_group_id:I0_group_name  
:config_node:UPS_unique_id:hardware:iscsi_name:iscsi_alias  
:panel_name:enclosure_id:canister_id:enclosure_serial_number  
1:node1::50050868010050B2:online:0:io_grp0:yes::100:iqn.1986-03.com.ibm  
:2145.cluster0.node1::02-1:2:1:123ABCG  
2:node2::50050869010050B2:online:0:io_grp0:no::100:iqn.1986-03.com.ibm  
:2145.cluster0.node2::02-2:2:2:123ABDG
```

2. Issue the **lsnodecandidate** CLI command to list nodes that are not assigned to a clustered system and to verify that a second node is added to an I/O group.

Note: The **lsnodecandidate** command is a SAN Volume Controller command. For Storwize V7000, use the **lscontrolenclosurecandidate** command.

The following is an example of the output that is displayed:

```
lsnodecandidate -delim :  
  
id:panel_name:UPS_serial_number:UPS_unique_id:hardware  
5005076801000001:000341:10L3ASH:202381001C0D18D8:8A4  
5005076801000009:000237:10L3ANF:202381001C0D1796:8A4  
50050768010000F4:001245:10L3ANF:202381001C0D1796:8A4  
....
```

3. Issue the **addnode** CLI command to add a node to the clustered system.

Note: The **addnode** command is a SAN Volume Controller command. For Storwize V7000, use the **addcontrolenclosure** command.

Important: Each node in an I/O group must be attached to a different uninterruptible power supply.

The following is an example of the CLI command you can issue to add a node to the clustered system by using the panel name parameter:

```
addnode -panelname 000237
        -iogrp io_grp0
```

Where *000237* is the panel name of the node, *io_grp0* is the name of the I/O group that you are adding the node to.

The following is an example of the CLI command you can issue to add a node to the clustered system by using the WWNN parameter:

```
addnode -wwnname 5005076801000001
        -iogrp io_grp1
```

Where *5005076801000001* is the WWNN of the node, *io_grp1* is the name of the I/O group that you are adding the node to.

4. Issue the **lsnode** CLI command to verify the final configuration.

The following example shows output that is displayed:

```
lsnode -delim :
id:name:UPS_serial_number:WWNN:status:I/O_group_id:I/O_group_name:config_node:UPS_unique_id:
hardware:iscsi_name:iscsi_alias
1:node1:10L3ASH:0000000000000000:offline:0:io_grp0:no:1000000000003206:
8A4:iqn.1986-03.com.ibm:2145.ndihill.node1:
```

Record the following information for the new node:

- Node name
- Node serial number
- WWNN
- IQNs (if using hosts attached by using iSCSI connections)
- All WWPNs
- I/O group that contains the node

Note: If this command is issued quickly after you add nodes to the clustered system, the status of the nodes might be adding. The status is shown as adding if the process of adding the nodes to the clustered system is still in progress. You do not have to wait for the status of all the nodes to be online before you continue with the configuration process.

Results

The nodes are added to the clustered system.

Displaying node properties by using the CLI

You can use the command-line interface (CLI) to display node properties.

About this task

To display the node properties:

Procedure

1. Use the **lsnode** CLI command to display a concise list of nodes in the clustered system.

Issue this CLI command to list the system nodes:

```
lsnode -delim :
```

2. Issue the **lsnode** CLI command and specify the node ID or name of the node that you want to receive detailed output.

The following example is a CLI command that you can use to list detailed output for a node in the system:

```
lsnode -delim : group1node1
```

Where *group1node1* is the name of the node for which you want to view detailed output.

Discovering MDisks using the CLI

You can use the command-line interface (CLI) to discover managed disks (MDisks).

About this task

The system automatically discovers the back-end controller and integrates the controller to determine the storage that is presented to the system nodes when back-end controllers are:

- Added to the Fibre Channel
- Included in the same switch zone as a system

The Small Computer System Interface (SCSI) logical units (LUs) that are presented by the back-end controller are displayed as unmanaged MDisks. However, if the configuration of the back-end controller is modified after this has occurred, the system might be unaware of these configuration changes. You can request that the system rescan the Fibre Channel SAN to update the list of unmanaged MDisks.

Note: The automatic discovery completed by the system does not write anything to an unmanaged MDisk. You must instruct the system to add an MDisk to a storage pool or use an MDisk to create an image mode volume.

Discover (and then view) a list of MDisks:

Procedure

1. Issue the **detectmdisk** CLI command to manually scan the Fibre Channel network. The scan discovers any new MDisks that might have been added to the system and can help rebalance MDisk access across the available controller device ports.

Notes:

- a. Only issue the **detectmdisk** command when you are sure that all of the disk controller ports are working and correctly configured in the controller and the SAN zoning. Failure to do this can result in errors that are not reported.
 - b. Although it might appear that the **detectmdisk** command has completed, extra time might be required for it to run. The **detectmdisk** is asynchronous and returns a prompt while the command continues to run in the background. You can use the **lsdiscoverystatus** command to view the discovery status.
2. When the detection is complete, issue the **lsmdiskcandidate** CLI command to show the unmanaged MDisks. These MDisks have not been assigned to a storage pool.
 3. Issue the **lsmdisk** CLI command to view all of the MDisks.

Results

You have now seen that the back-end controllers and switches have been set up correctly and that the system recognizes the storage that is presented by the back-end controller.

Example

This example describes a scenario where a single back-end controller is presenting eight SCSI LUs to the system:

1. Issue `detectmdisk`.
2. Issue `lsmdiskcandidate`.

This output is displayed:

```
id
0
1
2
3
4
5
6
7
```

- ### 3. Issue `lsmdisk -delim :`

This output is displayed:

```
lsmdisk -delim :
id:name:status:mode:mdisk_grp_id:mdisk_grp_name:capacity:ctrl_LUN_#:controller_name:UID:tier
0:mdisk0:online:unmanaged:::68.4GB:0000000000000000:controller0:
20000004cf2422aa0000000000000000000000000000000000000000000000000000:
1:mdisk1:online:unmanaged:::68.4GB:0000000000000000:controller1:
20000004cf1fd19d0000000000000000000000000000000000000000000000000000:
2:mdisk2:online:unmanaged:::68.4GB:0000000000000000:controller2:
20000004cf242531000000000000000000000000000000000000000000000000000:
```

Creating storage pools using the CLI

You can use the command-line interface (CLI) to create a storage pool.

Before you begin

Attention: If you add an MDisk to a storage pool as an MDisk, any data on the MDisk is lost. If you want to keep the data on an MDisk (for example, because you want to import storage that was previously not managed by the system), you must create image mode volumes instead.

Assume that the system has been set up and that a back-end controller has been configured to present new storage to the system.

If you are using a flash drive managed disk on your system, ensure that you are familiar with the flash drive configuration rules.

If you intend to keep the volume allocation within one storage system, ensure that all MDisks in the storage pool are presented by the same storage system.

Ensure that all MDisks that are allocated to a single storage pool are of the same RAID type. If the storage pool has more than one tier of storage, ensure that all MDisks in the same tier are of the same RAID type. When using Easy Tier®, all of the MDisks in a storage pool in the same tier must be similar and have similar performance characteristics. If you do not use Easy Tier, the storage pool must contain only one tier of storage, and all of the MDisks in the storage pool must be similar and have similar performance characteristics.

As you plan how many pools to create, consider the following factors:

- A volume can only be created using the storage from one storage pool. Therefore, if you create small (storage pools), you might lose the benefits that are provided by virtualization, namely more efficient management of [available capacity](#) and a more evenly distributed workload for better performance.
- If any MDisk in an storage pool goes offline, all the (volumes) in the storage pool go offline. Therefore you might want to consider using different storage pools for different back-end controllers or for different applications.

- If you anticipate regularly adding and removing back-end controllers or storage, this task is made simpler by grouping all the MDisks that are presented by a back-end controller into one storage pool.
- All the MDisks in a storage pool must have similar levels of performance or reliability, or both. If a storage pool contains MDisks with different levels of performance, the performance of the (volumes) in this group is limited by the performance of the slowest MDisk. If a storage pool contains MDisks with different levels of reliability, the reliability of the (volumes) in this group is that of the least reliable MDisk in the group.

Note: When you create a pool with a new flash drive, the new flash drive is automatically formatted and set to a block size of 512 bytes.

About this task

Even with the best planning, circumstances can change and you must reconfigure your (storage pools) after they have been created. The data migration facilities that are provided by the system enable you to move data without disrupting I/O.

Choosing a storage pool extent size

As you plan the extent size of each new pool, consider the following factors:

- You must specify the extent size when you create a new storage pool.
- You cannot change the extent size later; it must remain constant throughout the lifetime of the storage pool.
- Storage pools can have different extent sizes; however, this places restrictions on the use of data migration.
- The extent size affects the maximum size of a volume in the storage pool. A larger extent size increases the total amount of storage that the system can manage, and a smaller extent size allows more fine-grained control of storage allocation.

Table 8 on page 22 compares the maximum volume capacity for each extent size. The maximum is different for thin-provisioned volumes. Because the system allocates a whole number of extents to each volume that is created, using a larger extent size might increase the amount of storage that is wasted at the end of each volume. Larger extent sizes also reduces the ability of the system to distribute sequential I/O workloads across many MDisks and therefore can reduce the performance benefits of virtualization.

<i>Table 8. Maximum volume capacity by extent size</i>		
Extent size (MB)	Maximum volume capacity in GB (not thin-provisioned volumes)	Maximum volume capacity in GB (thin-provisioned volumes)
16	2048 (2 TB)	2000
32	4096 (4 TB)	4000
64	8192 (8 TB)	8000
128	16,384 (16 TB)	16,000
256	32,768 (32 TB)	32,000
512	65,536 (64 TB)	65,000
1024	131,072 (128 TB)	130,000
2048	262,144 (256 TB)	260,000
4096	262,144 (256 TB)	262,144
8192	262,144 (256 TB)	262,144

Important: You can specify different extent sizes for different storage pools; however, you cannot migrate (volumes) between storage pools with different extent sizes. If possible, create all your storage pools with the same extent size.

Use the following steps to create a storage pool:

Procedure

Issue the **mkmdiskgrp** CLI command to create a storage pool.

This is an example of the CLI command you can issue to create a storage pool:

```
mkmdiskgrp -name maindiskgroup -ext 32  
-mdisk mdsk0:mdsk1:mdsk2:mdsk3
```

where *maindiskgroup* is the name of the storage pool that you want to create, 32 MB is the size of the extent you want to use, and *mdsk0*, *mdsk1*, *mdsk2*, *mdsk3* are the names of the four MDisk that you want to add to the group.

Results

You created and added MDisk to a storage pool.

Example

The following example provides a scenario where you want to create a storage pool, but you do not have any MDisk available to add to the group. You plan to add the MDisk at a later time. You use the **mkmdiskgrp** CLI command to create the storage pool *bkpmdiskgroup* and later used the **addmdisk** CLI command to add *mdsk4*, *mdsk5*, *mdsk6*, *mdsk7* to the storage pool.

1. Issue **mkmdiskgrp -name bkpmdiskgroup -ext 32**

where *bkpmdiskgroup* is the name of the storage pool that you want to create and 32 MB is the size of the extent that you want to use.

2. You find four MDisk that you want to add to the storage pool.

3. Issue **addmdisk -mdisk mdsk4:mdsk5:mdsk6:mdsk7 bkpmdiskgroup**

where *mdsk4*, *mdsk5*, *mdsk6*, *mdsk7* are the names of the MDisk that you want to add to the storage pool and *bkpmdiskgroup* is the name of the storage pool for which you want to add MDisk.

Adding MDisk to storage pools using the CLI

You can use the command-line interface (CLI) to add managed disks (MDisk) to storage pools.

Before you begin

The MDisk must be in unmanaged mode. Disk that already belong to a storage pool cannot be added to another storage pool until they have been deleted from their current storage pool. An MDisk can be deleted from a storage pool under these circumstances:

- If the MDisk does not contain any extents in use by a volume
- If you can first migrate the extents in use onto other free extents within the group

About this task

Important: Do not add an MDisk using this procedure if you are mapping the MDisk to an image mode volume. Adding an MDisk to a storage pool enables the system to write new data to the MDisk; therefore, any existing data on the MDisk is lost. If you want to create an image mode volume, use the **mkvdisk** command instead of **addmdisk**.

If you are using a flash drive managed disk on your system, ensure that you are familiar with the flash drive configuration rules.

The system performs tests on the MDisk in the list before the MDisk are allowed to become part of a storage pool when:

- Adding MDisk to a storage pool using the **addmdisk** command

- Creating a storage pool using the **mkmdiskgrp -mdisk** command

These tests include checks of the MDisk identity, capacity, status and the ability to perform both read and write operations. If these tests fail or exceed the time allowed, the MDisks are not added to the group. However, with the **mkmdiskgrp -mdisk** command, the storage pool is still created even if the tests fail, but it does not contain any MDisks. If tests fail, confirm that the MDisks are in the correct state and that they have been correctly discovered.

These events contribute to an MDisk test failure:

- The MDisk is not visible to all system nodes in the clustered system.
- The MDisk identity has changed from a previous discovery operation.
- The MDisk cannot perform read or write operations.
- The status of the MDisk can be either degraded paths, degraded ports, excluded, or offline.
- The MDisk does not exist.

These events contribute to an MDisk test timeout:

- The disk controller system on which the MDisk resides is failing.
- A SAN fabric or cable fault condition exists that is preventing reliable communication with the MDisk.

Note: The first time that you add a new flash drive to a pool, the flash drive is automatically formatted and set to a block size of 512 bytes.

Procedure

To add MDisks to storage pools, complete the following steps.

1. Issue the **lsmdiskgrp** CLI command to list the existing storage pools.

This example is a CLI command that you can issue to list the existing storage pools:

```
lsmdiskgrp -delim :
```

This is an example of the output that is displayed:

```
id:name:status:mdisk_count:vdisk_count:
capacity:extent_size:free_capacity:virtual_capacity:
used_capacity:real_capacity:overallocation:warning
0:mdiskgrp0:online:3:4:33.3GB:16:32.8GB:64.00MB:64.00MB:0:0
1:mdiskgrp1:online:2:1:26.5GB:16:26.2GB:16.00MB:16.00MB:16.00MB:0:0
2:mdiskgrp2:online:2:0:33.4GB:16:33.4GB:0.00MB:0.00MB:0.00MB:0:0
```

2. Issue the **addmdisk** CLI command to add MDisks to the storage pool.

This is an example of the CLI command you can issue to add MDisks to a storage pool:

```
svctask addmdisk -mdisk mdisk4:mdisk5:mdisk6:mdisk7 bkpmdiskgroup
```

Where *mdisk4:mdisk5:mdisk6:mdisk7* are the names of the MDisks that you want to add to the storage pool and *bkpmdiskgroup* is the name of the storage pool for which you want to add the MDisks.

Setting a quorum disk using the CLI

You can set an external managed disk (MDisk) as a quorum disk by using the command-line interface (CLI).

Note: Quorum functionality is not supported for internal drives on nodes.

To set an MDisk as a quorum disk, use the **chquorum** command. **Storwize V7000:** To set an external MDisk as a quorum disk, use the **chquorum** command.

When setting an MDisk as a quorum disk, keep the following recommendations in mind:

- When possible, distribute the quorum candidate disks so that each MDisk is provided by a different storage system. For a list of storage systems that support quorum disks, search for supported hardware list at the following website:

www.ibm.com/support

- Before you set the quorum disk with the **chquorum** command, use the **lsmdisk** or **lsdrive** command to ensure that the MDisk you want is online. If you want to set a drive as quorum, use **lsdrive** to make sure it is online. If you want to set an MDisk as quorum, use **lsmdisk** to make sure it is online.

Quorum disk configuration describes how quorum disks are used by the system, and how they are selected. The system automatically assigns quorum disks. Do not override the quorum disk assignment if you have a system without external MDisks. For a system with more than one control enclosure and with external MDisks, distribute the quorum candidate disks (when possible) so that each MDisk is provided by a different storage system. For a list of storage systems that support quorum disks, search for supported hardware list at the following website:

www.ibm.com/support

Modifying the amount of available memory for Copy Services, Volume Mirroring, and RAID arrays by using the CLI

You can use the command-line interface (CLI) to modify the amount of memory that is available for RAID arrays, the volume mirroring feature, and the FlashCopy, Metro Mirror, Global Mirror, or HyperSwap active-active Copy Services features.

About this task

Copy Services functions require that small amounts of volume cache be converted from cache memory into bitmap memory to allow the functions to operate. If you do not have enough bitmap space allocated when you try to use one of the functions, you will not be able to complete the configuration.

The total memory that can be dedicated to these functions is not defined by the physical memory in the system. The memory is constrained by the software functions that use the memory.

In planning the installation for a system, consider the future requirements for the advanced functions.

The following tables describe the amount of bitmap space necessary to configure the various Copy Services functions and RAID:

This table provides an example of the amount of memory that is required for remote mirroring functions, FlashCopy functions, and volume mirroring.

Table 9. Examples of memory required		
Function	Grain size	1 MiB of memory provides the following provisioned capacity for the specified I/O group
Remote copy	256 KiB	2 TiB of total Metro Mirror, Global Mirror, or HyperSwap provisioned capacity
FlashCopy	256 KiB	2 TiB of total FlashCopy source provisioned capacity
FlashCopy	64 KiB	512 GiB of total FlashCopy source provisioned capacity
Incremental FlashCopy	256 KiB	1 TiB of total incremental FlashCopy source provisioned capacity

Table 9. Examples of memory required (continued)

Function	Grain size	1 MiB of memory provides the following provisioned capacity for the specified I/O group
Incremental FlashCopy	64 KiB	256 GiB of total incremental FlashCopy source provisioned capacity
Volume mirroring	256 KiB	2 TiB of mirrored provisioned capacity
<p>Notes:</p> <ol style="list-style-type: none"> 1. For multiple FlashCopy targets, you must consider the number of mappings. For example, for a mapping with a grain size of 256 KiB, 8 KiB of memory allows one mapping between a 16 GiB source volume and a 16 GiB target volume. Alternatively, for a mapping with a 256 KiB grain size, 8 KiB of memory allows two mappings between one 8 GiB source volume and two 8 GiB target volumes. 2. When creating a FlashCopy mapping, if you specify an I/O group other than the I/O group of the source volume, the memory accounting goes toward the specified I/O group, not toward the I/O group of the source volume. 3. For volume mirroring, the full 512 MiB of memory space enables 1 PiB of total provisioned capacity. 4. When creating new FlashCopy relationships or mirrored volumes, additional bitmap space is allocated automatically by the system if required. 		

Table 10 on page 26 provides the approximate memory cost for each array in an I/O group, where MS is the size of each member drive and MC is the number of member drives in the array. For multiple arrays in an I/O group, adding the costs together to get the RAID feature size for the I/O group.

Table 10. RAID level bitmap memory costs

Level	Member count	Approximate capacity	Redundancy	Approximate bitmap memory cost
RAID-0	1-8	MC * MS	None	(1 MB per 2 TB of MS) * MC
RAID-1	2	MS	1	(1 MB per 2 TB of MS) * (MC/2)
RAID-5	3-16	(MC-1) * MS	1	1 MB per 2 TB of MS with a strip size of 256 KB; double with strip size of 128 KB.
RAID-6	5-16	less than (MC-2 * MS)	2	
RAID-10	2-16 (evens)	MC/2 * MS	1	(1 MB per 2 TB of MS) * (MC/2)
<p>Note: There is a margin of error on the approximate bitmap memory cost of approximately 15%. For example, the cost for a 256 KB strip size for RAID-5 is ~1.15 MB for the first 2 TB of MS.</p>				

Before you specify the configuration changes, consider the following factors:

- For FlashCopy mappings, only one I/O group consumes bitmap space. By default, the I/O group of the source volume is used.
- For Metro Mirror, Global Mirror, and HyperSwap active-active relationships, two bitmaps exist. For Metro Mirror or Global Mirror relationships, one is used for the master system and one is used for the auxiliary system because the direction of the relationship can be reversed. For active-active

relationships, which are configured automatically when HyperSwap volumes are created, one bitmap is used for the volume copy on each site because the direction of these relationships can be reversed.

- When you create a reverse mapping; for example, to run a restore operation from a snapshot to its source volume; a bitmap is also created for this reverse mapping.
- When you configure change volumes for use with Global Mirror or Metro Mirror, two internal FlashCopy mappings are created for each change volume.
- The smallest possible bitmap is 4 KiB; therefore, a 512 byte volume requires 4 KiB of bitmap space.

On existing systems, also consider these factors:

- When you create FlashCopy mappings and mirrored volumes, HyperSwap volumes, or formatted, [standard-provisioned](#) volumes, the system attempts to automatically increase the available bitmap space. You do not need to manually increase this space.
- Metro Mirror and Global Mirror relationships do not automatically increase the available bitmap space. You might need to use the **chiogrp** command or the management GUI to manually increase the space in one or both of the master and auxiliary systems.

To modify and verify the amount of memory that is available, complete the following steps:

Procedure

1. Issue the following command to modify the amount of memory that is available for Volume Mirroring or a Copy Service feature:

```
chiogrp -feature flash | remote | mirror -size memory_size io_group_id /  
io_group_name
```

where *flash | remote | mirror* is the feature that you want to modify, *memory_size* is the amount of memory that you want to be available, and *io_group_id* / *io_group_name* is the ID or name of the I/O group for which you want to modify the amount of available memory.

2. Issue the following command to verify that the amount of memory has been modified:

```
lsiogrp object_id | object_name
```

where *object_id* / *object_name* is the ID or name of the I/O group for which you have modified the amount of available memory.

The following information is an example of the output that is displayed.

```
id 0  
name io_grp0  
node_count 2  
vdisk_count 40  
host_count 1  
flash_copy_total_memory 5.0MB  
flash_copy_free_memory 5.0MB  
remote_copy_total_memory 20.0MB  
remote_copy_free_memory 20.0MB  
mirroring_total_memory 20.0MB  
mirroring_free_memory 20.0MB  
raid_total_memory 40.0MB  
raid_free_memory 0.1MB  
maintenance no  
compression_active no  
accessible_vdisk_count 40  
compression_supported yes  
max_enclosures 21  
encryption_supported yes
```

Creating volumes using the CLI

You can use the command-line interface (CLI) to create a volume. You can create volumes that are not high availability volumes or you can create high availability volumes.

Before you begin

If the volume that you are creating maps to a flash drive, the data that is stored on the volume is not protected against Flash drive failures or node failures. To avoid data loss, add a volume copy that maps to a Flash drive on another node.

This task assumes that the system has been set up and that you have created storage pools. You can establish an empty storage pool to hold the MDisks that are used for image mode volumes.

About this task

Note: If you want to keep the data on an MDisk, create image mode (volumes). This task describes how to create a volume with striped virtualization.

Use the **mkvdisk** command to create sequential, striped, or image mode volumes that are not high availability volumes. Use the **mkvolume** command to create high availability volumes (or volumes that are not high availability). Use the **mkimagevolume** command to create an image mode volume by importing (preserving) data on a managed disk from another storage system.

Procedure

To create volumes, complete these steps.

1. Issue the **lsmdiskgrp** CLI command to list the available storage pools and the amount of free storage in each group.

Issue this CLI command to list storage pools:

```
lsmdiskgrp -delim :
```

This output is displayed:

```
id:name:status:mdisk_count:vdisk_count:capacity:extent_size:free_capacity:virtual_capacity:
used_capacity:real_capacity:overallocation:warning:easy_tier:easy_tier_status
0:mdiskgrp0:degraded:4:0:34.2GB:16:34.2GB:0:0:0:0:auto:inactive
1:mdiskgrp1:online:4:6:200GB:16:100GB:400GB:75GB:100GB:200:80:on:active
```

2. Decide which storage pool you want to provide the storage for the volume.
3. Issue the **lsiogrp** CLI command to show the I/O groups and the number of volumes assigned to each I/O group.

Note: It is normal for systems with more than one I/O group to have **mkvdisk** that have volumes in different I/O groups. You can use FlashCopy to make copies of volumes regardless of whether the source and target volume are in the same I/O group.

Similarly, if you plan to use intra-system Metro Mirror or Global Mirror, both the master and auxiliary volume can be in the same I/O group or different I/O groups.

Issue this CLI command to list I/O groups:

```
lsiogrp -delim :
```

This output is displayed:

```
id:name:node_count:vdisk_count:host_count
0:io_grp0:2:0:2
1:io_grp1:2:0:1
2:io_grp2:0:0:0
3:io_grp3:0:0:0
4:recovery_io_grp:0:0:0
```

4. Decide which I/O group you want to assign the volume to. This determines which system nodes in the system process the I/O requests from the host systems. If you have more than one I/O group, make sure you distribute the volumes between the I/O groups so that the I/O workload is shared evenly between all system nodes.
5. Issue the `mkvdisk` CLI command to create a volume (that is not a high availability volume) that uses striped virtualization. Use the **mkvolume** command to create high availability volumes.

The rate at which the volume copies resynchronize after loss of synchronization can be specified by using the **-syncrate** parameter. [Table 11 on page 29](#) defines the rates. These settings also affect the initial rate of formatting.

Table 11. Volume copy resynchronization rates	
Syncrate value	Data copied per second
1-10	128 KB
11-20	256 KB
21-30	512 KB
31-40	1 MB
41-50	2 MB
51-60	4 MB
61-70	8 MB
71-80	16 MB
81-90	32 MB
91-100	64 MB

The default setting is 50. The synchronization rate must be set such that the volume copies resynchronize quickly after loss of synchronization.

Issue this CLI command to create a volume with two copies using the I/O group and storage pool name and specifying the synchronization rate:

```
mkvdisk -iogrp io_grp1 -mdiskgrp grpa:grpb -size500 -vtype striped
-copies 2 -syncrate 90
```

where *io_grp1* is the name of the I/O group that you want the volume to use, *grpa* is the name of the storage pool for the primary copy of the volume and *grpb* is the name of the storage pool for the second copy of the volume, and 2 is the number of volume copies and the synchronization rate is 90 which is equivalent to 32MB per second.

Issue this CLI command to create a volume using the I/O group ID and storage pool ID:

```
mkvdisk -name mainvdisk1 -iogrp 0
-mdiskgrp 0 -vtype striped -size 256 -unit gb
```

where *mainvdisk1* is the name that you want to call the volume, 0 is the ID of the I/O group that want the volume to use, 0 is the ID of the storage pool that you want the volume to use, and 256 is the capacity of the volume.

Issue this CLI command to create a thin-provisioned volume using the I/O group and storage pool name:

```
mkvdisk -iogrp io_grp1 -mdiskgrp bkpmdiskgroup -vtype striped  
-size 10 unit gb -isize 20% -autoexpand -grainsize 32
```

where *io_grp1* is the name of the I/O group that you want the volume to use and 20% is how much real storage to allocate to the volume, as a proportion of its virtual size. In this example, the size is 10 GB so that 2 GB will be allocated.

Issue this CLI command to create a volume with two copies using the I/O group and storage pool name:

```
mkvdisk -iogrp io_grp1 -mdiskgrp grpa:grpb  
-size 500 -vtype striped -copies 2
```

where *io_grp1* is the name of the I/O group that you want the volume to use, *grpa* is the name of the storage pool for the primary copy of the volume and *grpb* is the name of the storage pool for the second copy of the volume, and 2 is the number of volume copies.

Issue this CLI command to create a striped high availability volume:

```
mkvolume -pool 0:1 -size 1000
```

This creates a volume in storage pool 0 with a capacity of 1000 MBs.

Issue this CLI command to create an image mode volume:

```
mkimagevolume -mdisk 7 -pool 1 -thin -size 25 -unit gb
```

This imports a thin-provisioned image mode volume with a provisioned capacity of 25 GB in storage pool 1 using MDisk 7.

Note: If you want to create two volume copies of different types, create the first copy using the **mkvdisk** command and then add the second copy using the **addvdiskcopy** command. To create a high availability volume, use the **mkvolume** command. To convert a basic volume to a high availability volume use the **addvolumeecopy** command.

6. Issue the **lsvdisk** CLI command to list all the volumes that have been created.

Adding a copy to a volume

You can use the management GUI or command-line interface (CLI) to add a mirrored copy to a volume. Each volume can have a maximum of two copies.

Before you begin

The system supports mirrored copies for both standard topology, which consists of a single site, and HyperSwap and stretched system topologies, which consist of multiple sites. Both HyperSwap and stretched system topologies are used for high availability configurations. However, in HyperSwap topologies, separate I/O groups are at each site. For stretched system, individual I/O groups are split between sites with each node in the I/O group at separate sites. If you are adding a mirrored copy to a volume used in a standard topology, use the **addvdiskcopy** command or the management GUI. For HyperSwap and stretched volumes, use the **addvolumeecopy**. In the management GUI, select **Volumes**, right-click the volume, and select **Add Volume Copies**.

Deleting a copy from a volume

You can use the management GUI or command-line interface (CLI) to delete a copy from a volume.

Before you begin

The system supports mirrored copies for both standard topology, which consists of a single site, and HyperSwap and stretched system topologies, which consist of multiple sites. Both HyperSwap and stretched system topologies are used for high availability configurations. However, in HyperSwap topologies, separate I/O groups are at each site. For stretched system, individual I/O groups are split between sites with each node in the I/O group at separate sites. The system supports mirrored copies for both standard topology, which consists of a single site, and HyperSwap and stretched system topologies, which consist of multiple sites. Both HyperSwap and stretched system topologies are used for high availability configurations. However, in HyperSwap topologies, separate I/O groups are at each site. For stretched system, individual I/O groups are split between sites with each node in the I/O group at separate sites. If you are deleting a copy to a volume used in a single system, use the **rmvdiskcopy** command or the management GUI. For HyperSwap volumes, use the **rmvolumecopy**. In the management GUI, select **Volumes**, right-click the volume copy, and select **Delete this Copy**.

Configuring host objects

You can use the management GUI or command-line interface (CLI) to create host objects.

Before you begin

If you are configuring a host object on a Fibre Channel attached host, ensure that you have completed all zone and switch configuration. Also test the configuration to ensure that zoning was created correctly.

If you are configuring a host object on the system that uses iSCSI connections, ensure that you have completed the necessary host-system configurations and have configured the system for iSCSI connections.

At least one WWPN or iSCSI name must be specified.

To create a host object in the management GUI, select **Hosts** > **Hosts** > **Add Hosts**.

About this task

To create host objects with the command-line interface, use the following steps:

Procedure

1. Issue the **mkhost** CLI command to create a logical host object for a Fibre Channel attached host. Assign your worldwide port name (WWPN) for the host bus adapters (HBAs) in the hosts.

This is an example of the CLI command that you can issue to create a Fibre Channel attached host:

```
mkhost -name new_name -fcwwpn wwpn_list
```

where *new_name* is the name of the host and *wwpn_list* is the WWPN of the HBA.

2. To create an iSCSI-attached host, issue the following CLI command:

```
mkhost -iscsiname iscsi_name_list
```

where *iscsi_name_list* specifies one or more iSCSI qualified names (IQNs) of this host. Up to 16 names can be specified, provided that the command-line limit is not reached. Each name should comply with the iSCSI standard, RFD 3720.

3. To add ports to a Fibre Channel attached host, issue the **addhostport** CLI command.

For example, issue the following CLI command:

```
addhostport -hbawwpn wwpn_list new_name
```

This command adds another HBA WWPN *wwpn_list* to the host that was created in step “1” on page 31.

4. To add ports to an iSCSI-attached host, issue the **addhostport** CLI command.

For example, issue the following CLI command:

```
addhostport -iscsiname iscsi_name_list new_name
```

where *iscsi_name_list* specifies the comma-separated list of IQNs to add to the host. This command adds an IQN to the host that was created in step “2” on page 31.

5. To set up Challenge Handshake Authentication Protocol (CHAP) to authenticate iSCSI-attached hosts, issue the **chhost** CLI command.

The system supports both one-way and two-way CHAP authentication. In one-way CHAP authentication, the system authenticates to the host and with two-way chap authentication, both the host and the system authenticate to each other. You can specify the one-way chap secret and the user name for that host object by using the **chhost** command that will be used in one-way chap authentication. For example, issue the following CLI command:

```
chhost -chapsecret chap_secret -iscsiusername username
```

where *chap_secret* is the CHAP secret that is used to authenticate the host for iSCSI I/O and *username* is the user name for the host object and is used in one-way authentication for iSCSI host logins. If this parameter is not specified, the IQN for the host is used as the user name. To list the CHAP secret and the user name for each host, use the **lsiscsiauth** command. To clear any previously set CHAP secret for a host, use the **chhost -nochapsecret** command.

What to do next

After you create the host object on the system, you can map volumes to a host.

If you are unable to discover the disk on the host system or if there are fewer paths available for each disk than expected, test the connectivity between your host system and the system. Depending on the connection type to the host, these steps might be different. For iSCSI-attached hosts, test your connectivity between the host and system ports by pinging the system from the host. Ensure that the firewall and router settings are configured correctly and validate that the values for the subnet mask and gateway are specified correctly for the system host configuration.

For Fibre Channel attached hosts, ensure that the active switch configuration includes the host zone and check the host-port link status. To verify end-to-end connectivity, you can use the **lsfabric** CLI command or the View Fabric panel under the Service and Maintenance container in the management GUI.

Creating host mappings by using the CLI

You can use the command-line interface (CLI) to create volume-to-host mappings (host mappings).

About this task

Note: To understand the CLI for creating shared mappings in a host cluster, see the information about host clusters and the **mkhostcluster** command.

To create host mappings, follow these steps:

Procedure

1. Issue the **mkvdiskhostmap** CLI command to create host mappings.

This example is a CLI command that you can issue to create host mappings:

```
mkvdiskhostmap -host demohost1 mainvdisk1
```

Where *demohost1* is the name of the host and *mainvdisk1* is the name of the volume.

2. After you map volumes to hosts, discover the disks on the host system. This step requires that you access the host system and use the host system utilities to discover the new disks that are made available by the system. You also have the option of creating a file system for those new disks. For more information about completing this task, see your host system documentation.

Creating FlashCopy mappings by using the CLI

You can use the command line interface (CLI) to create FlashCopy mappings.

Before you begin

A FlashCopy mapping specifies the source and target volume. Source volumes and target volumes must meet these requirements:

- They must be the same size.
- They must be managed by the same system.

About this task

A volume can be the source in up to 256 mappings. A mapping is started at the point in time when the copy is required.

This task creates FlashCopy mappings:

Procedure

1. The source and target volume must be the exact same size. Issue the **lsvdisk -bytes** CLI command to find the size (capacity) of the volume in bytes.
2. Issue the **mkfcmap** CLI command to create a FlashCopy mapping.

This CLI command example creates a FlashCopy mapping and sets the copy rate:

```
mkfcmap -source mainvdisk1 -target bkpvdisk1  
-name main1copy -copyrate 75
```

Where *mainvdisk1* is the name of the source volume, *bkpvdisk1* is the name of the volume that you want to make the target volume, *main1copy* is the name that you want to call the FlashCopy mapping, and 75 is the copy rate (which translates to MB per second).

This is an example of the CLI command you can issue to create FlashCopy mappings without the copy rate parameter:

```
mkfcmap -source mainvdisk2 -target bkpvdisk2  
-name main2copy
```

Where *mainvdisk2* is the name of the source volume, *bkpvdisk2* is the name of the volume that you want to make the target volume, *main2copy* is the name that you want to call the FlashCopy mapping.

Note: The default copy rate of 50 (which translates to 2 MB per second) is used when you do not specify a copy rate.

If the specified source and target volumes are also the target and source volumes of an existing mapping, the mapping that is being created and the existing mapping become partners. If one mapping is created as incremental, its partner is automatically incremental. A mapping can have only one partner.

3. Issue the **lsfcmap** CLI command to check the attributes of the FlashCopy mappings that were created:

This is an example of a CLI command that you can issue to view the attributes of the FlashCopy mappings:

```
lsfcmap -delim :
```

Where **-delim** specifies the delimiter and is an example of the output that is displayed:

```
id:name:source_vdisk_id:source_vdisk_name:target_vdisk_id:target_vdisk_name:
group_id:group_name:status:progress:copy_rate:clean_progress:incremental
0:main1copy:77:vdisk77:78:vdisk78:::idle_or_copied:0:75:100:off
1:main2copy:79:vdisk79:80:vdisk80:::idle_or_copied:0:50:100:off
```

Preparing and starting a FlashCopy mapping by using the CLI

Before you start the FlashCopy process by using the command line interface (CLI), you must prepare a FlashCopy mapping.

About this task

Starting a FlashCopy mapping creates a point-in-time copy of the data on the source volume and writes it to the target volume for the mapping.

These steps help you prepare and start a FlashCopy mapping:

Procedure

1. Issue the **prestartfcmap** CLI command to prepare the FlashCopy mapping.

To run the following command, the FlashCopy mapping cannot belong to a consistency group.

```
prestartfcmap -restore main1copy
```

Where *main1copy* is the name of the FlashCopy mapping.

This command specifies the optional **restore** parameter, which forces the mapping to be prepared even if the target volume is being used as a source in another active FlashCopy mapping.

The mapping enters the preparing state and moves to the prepared state when it is ready.

2. Issue the **lsfcmap** CLI command to check the state of the mapping.

The following code is an example of the output that is displayed:

```
lsfcmap -delim :
id:name:source_vdisk_id:source_vdisk_name:target_vdisk_id:
target_vdisk_name:group_id:group_name:status:progress:copy_rate
0:main1copy:0:mainvdisk1:1:bkpvdisk1:::prepared:0:50
```

3. Issue the **startfcmap** CLI command to start the FlashCopy mapping.

The following code is an example of the CLI command you can issue to start the FlashCopy mapping:

```
startfcmap -restore main1copy
```

Where *main1copy* is the name of the FlashCopy mapping.

This command specifies the optional **restore** parameter, which forces the mapping to be started even if the target volume is being used as a source in another active FlashCopy mapping.

4. Issue the **lsfcmapprogress** CLI command with the FlashCopy mapping name or ID to check the progress of the mapping.

The following code is an example of the output that is displayed; the FlashCopy mapping ID 0 is 47% completed.

```
lsfcmapprogress -delim :  
id:progress  
0:47
```

Results

You created a point-in-time copy of the data on a source volume and wrote that data to a target volume. The data on the target volume is only recognized by the hosts that are mapped to it.

Stopping FlashCopy mappings by using the CLI

You can use the command-line interface (CLI) to stop a FlashCopy mapping.

About this task

Follow these steps to stop a single stand-alone FlashCopy mapping.

Procedure

1. To stop a FlashCopy mapping, issue the following **stopfcmap** command:

```
stopfcmap fc_map_id or fc_map_name
```

where *fc_map_id* or *fc_map_name* is the ID or name of the mapping to stop.

2. To stop immediately all processing that is associated with the mapping and break the dependency on the source volume of any mappings that are also dependent on the target disk, issue the following command:

```
stopfcmap -force -split fc_map_id or fc_map_name
```

When you use the **force** parameter, all FlashCopy mappings that depend on this mapping (as listed by the **lsfcmapdependentmaps** command) are also stopped.

Important: Using the **force** parameter might result in a loss of access. Use it only under the direction of the IBM Support Center.

The **split** parameter can be specified only when stopping a map that has a progress of 100 as shown by the **lsfcmap** command. The **split** parameter removes the dependency of any other mappings on the source volume. It might be used before starting another FlashCopy mapping whose target disk is the source disk of the mapping that is being stopped. After the mapping is stopped with the **split** option, you can start the other mapping without the **restore** option.

Deleting a FlashCopy mapping using the CLI

You can use the command-line interface (CLI) to delete a FlashCopy mapping.

Before you begin

The **rmfcmap** CLI command deletes an existing mapping if the mapping is in the `idle_or_copied` or `stopped` state. If it is in the `stopped` state, the **force** parameter is required to specify that the target volume is brought online. If the mapping is in any other state, you must stop the mapping before you can delete it.

If deleting the mapping splits the tree that contains the mapping, none of the mappings in either resulting tree can depend on any mapping in the other tree. To display a list of dependent FlashCopy mappings, use the **lsfcmapdependentmaps** command.

About this task

Procedure

1. To delete an existing mapping, issue the **rmfcmap** CLI command:

```
rmfcmap fc_map_id or fc_map_name
```

where *fc_map_id* or *fc_map_name* is the ID or name of the mapping to delete.

2. To delete an existing mapping and bring the target volume online, issue the following command:

```
rmfcmap -force fc_map_id or fc_map_name
```

where *fc_map_id* or *fc_map_name* is the ID or name of the mapping to delete.

Results

The command does not return any output.

Creating a FlashCopy consistency group and adding mappings using the CLI

You can use the command-line interface (CLI) to create and add mappings to a FlashCopy consistency group.

About this task

If you have created several FlashCopy mappings for a group of volumes that contain elements of data for the same application, it can be convenient to assign these mappings to a single FlashCopy consistency group. You can then issue a single prepare or start command for the whole group. For example, you can copy all of the files for a database at the same time.

Procedure

To add FlashCopy mappings to a new FlashCopy consistency group, complete the following steps.

1. Issue the **mkfcconsistgrp** CLI command to create a FlashCopy consistency group.

The following CLI command is an example of the command you can issue to create a FlashCopy consistency group:

```
mkfcconsistgrp -name FCcgrp0 -autodelete
```

Where **FCcgrp0** is the name of the FlashCopy consistency group. The **-autodelete** parameter specifies to delete the consistency group when the last FlashCopy mapping is deleted or removed from the consistency group.

2. Issue the **lsfcconsistgrp** CLI command to display the attributes of the group that you have created.

The following CLI command is an example of the command you can issue to display the attributes of a FlashCopy consistency group:

```
lsfcconsistgrp -delim : FCcgrp0
```

The following output is an example of the output that is displayed:

```
id:1
name:FCcgrp0
status:idle_or_copied
autodelete:on
FC_mapping_id:0
FC_mapping_name:fcmap0
FC_mapping_id:1
FC_mapping_name:fcmap1
```

Note: For any group that has just been created, the status reported is empty

3. Issue the `chfcmap` CLI command to add FlashCopy mappings to the FlashCopy consistency group:

The following CLI commands are examples of the commands you can issue to add Flash Copy mappings to the FlashCopy consistency group:

```
chfcmap -consistgrp FCcgrp0 main1copy
chfcmap -consistgrp FCcgrp0 main2copy
```

Where **FCcgrp0** is the name of the FlashCopy consistency group and *main1copy*, *main2copy* are the names of the FlashCopy mappings.

4. Issue the `lsfcmap` CLI command to display the new attributes of the FlashCopy mappings.

The following output is an example of the output that is displayed:

```
lsfcmap -delim :
id:name:source_vdisk_id:source_vdisk_name:target_vdisk_id:
target_vdisk_name:group_id:group_name:status:progress:copy_rate
0:main1copy:28:maindisk1:29:bkpdisk1:1:FCcgrp0:idle_copied::75
1:main2copy:30:maindisk2:31:bkpdisk2:1:FCcgrp0:idle_copied::50
```

5. Issue the `lsfcconsistgrp` CLI command to display the detailed attributes of the group.

The following CLI command is an example of the command that you can issue to display detailed attributes:

```
lsfcconsistgrp -delim : FCcgrp0
```

Where **FCcgrp0** is the name of the FlashCopy consistency group, and **-delim** specifies the delimiter.

The following output is an example of the output that is displayed:

```
id:1
name:FCcgrp0
status:idle_or_copied
autodelete:off
FC_mapping_id:0
FC_mapping_name:main1copy
FC_mapping_id:1
FC_mapping_name:main2copy
```

Preparing and starting a FlashCopy consistency group using the CLI

You can use the command-line interface (CLI) to prepare and start a FlashCopy consistency group to start the FlashCopy process.

About this task

The successful completion of the FlashCopy process creates a point-in-time copy of the data on the source virtual disk or VDisk (volume) and writes it to the target volume for each mapping in the group. When several mappings are assigned to a FlashCopy consistency group, only a single prepare command is issued to prepare every FlashCopy mapping in the group; only a single start command is issued to start every FlashCopy mapping in the group.

Procedure

To prepare and start a FlashCopy consistency group, complete the following steps.

1. Issue the `prestartfcconsistgrp` CLI command to prepare the FlashCopy consistency group. This command must be issued before the copy process can begin.

Remember: A single prepare command prepares all of the mappings simultaneously for the entire group.

An example of the CLI command issued to prepare the FlashCopy consistency group:

```
prestartfcconsistgrp -restore maintobkpfcopy
```

Where *maintobkpfcopy* is the name of the FlashCopy consistency group

The optional **restore** parameter forces the consistency group to be prepared, even if the target volume is being used as a source volume in another active mapping. An active mapping is in the copying, suspended, or stopping state.

The group enters the preparing state, and then moves to the prepared state when it is ready.

2. Issue the `lsfcconsistgrp` command to check the status of the FlashCopy consistency group.

An example of the CLI command issued to check the status of the FlashCopy consistency group.

```
lsfcconsistgrp -delim :
```

An example of the output displayed:

```
id:name:status
1:maintobkpfcopy:prepared
```

3. Issue the `startfcconsistgrp` CLI command to start the FlashCopy consistency group to make the copy.

Remember: A single start command starts all the mappings simultaneously for the entire group.

An example of the CLI command issued to start the FlashCopy consistency group mappings:

```
startfcconsistgrp -prep -restore maintobkpfcopy
```

Where *maintobkpfcopy* is the name of the FlashCopy consistency group

Include the **prep** parameter, and the system automatically issues the **prestartfcconsistgrp** command for the specified group.

Note: Combining the **restore** parameter with the **prep** parameter, force-starts the consistency group. This occurs even if the target volume is being used as a source volume in another active mapping. An active mapping is in the copying, suspended, or stopping state.

The FlashCopy consistency group enters the copying state and returns to the `idle_copied` state when complete.

4. Issue the `lsfcconsistgrp` command to check the status of the FlashCopy consistency group.

An example of the CLI command issued to check the status of the FlashCopy consistency group:

```
lsfcconsistgrp -delim : maintobkpfcopy
```

Where *maintobkpfcopy* is the name of the FlashCopy consistency group

An example of the output that is displayed during the copying process:

```
id:name:status
1:maintobkpfcopy:copying
```

An example of the output that is displayed when the process copying is complete:

```
id:1
name:maintobkpfcopy
status:idle_copied
autodelete:off
FC_mapping_id:0
FC_mapping_name:main1copy
FC_mapping_id:1
FC_mapping_name:main2copy
```

Stopping a FlashCopy consistency group using the CLI

You can use the command-line interface (CLI) to stop a FlashCopy consistency group.

Before you begin

The **stopfcconsistgrp** CLI command stops all processing that is associated with a FlashCopy consistency group that is in one of the following processing states: prepared, copying, stopping, or suspended.

About this task

Procedure

1. To stop a FlashCopy consistency group, issue the **stopfcconsistgrp** CLI command:

```
stopfcconsistgrp fc_map_id or fc_map_name
```

where *fc_map_id* or *fc_map_name* is the ID or name of the mapping to delete.

2. To stop a consistency group and break the dependency on the source volumes of any mappings that are also dependent on the target volume, issue the following command:

```
stopfcconsistgrp -split fc_map_id or fc_map_name
```

You can specify the **split** parameter when all the maps in the group have a progress of 100. It removes the dependency of any other maps on the source volumes. You can use this option before you start another FlashCopy consistency group whose target disks are the source disks of the mappings that are being stopped. After the consistency group is stopped with the split option, you can start the other consistency group without the restore option.

Results

The command does not return any output.

Deleting a FlashCopy consistency group using the CLI

You can use the command-line interface (CLI) to delete a FlashCopy consistency group.

Before you begin

The **rmfcconsistgrp** CLI command deletes an existing FlashCopy consistency group. The **-force** parameter is required only when the consistency group that you want to delete contains mappings.

About this task

Follow these steps to delete an existing consistency group:

Procedure

1. To delete an existing consistency group that does not contain mappings, issue the **rmfcconsistgrp** CLI command:

```
rmfcconsistgrp fc_map_id or fc_map_name
```

where *fc_map_id* or *fc_map_name* is the ID or name of the consistency group to delete.

2. To delete an existing consistency group that contains mappings that are members of the consistency group, issue the following command:

```
rmfcconsistgrp -force fc_map_id or fc_map_name
```

where *fc_map_id* or *fc_map_name* is the ID or name of the mapping to delete.

Important: Using the **-force** parameter might result in a loss of access. Use it only under the direction of your support center.

All the mappings that are associated with the consistency group are removed from the group and changed to stand-alone mappings. To delete a single mapping in the consistency group, you must use the **rmfcmap** command.

Results

The command does not return any output.

Creating Metro Mirror, Global Mirror, or active-active relationships by using the CLI

You can use the command-line interface (CLI) to create Metro Mirror, Global Mirror, or active-active relationships.

About this task

Complete these steps to create Metro Mirror, Global Mirror, or active-active relationships:

Procedure

1. To create a Metro Mirror relationship, run the `mkrcrelationship` command.
For example, enter:

```
mkrcrelationship -master master_volume_id  
-aux aux_volume_id -cluster system_id
```

Where *master_volume_id* is the ID of the master volume, *aux_volume_id* is the ID of the auxiliary volume, and *system_id* is the ID of the remote clustered system.

2. To create a new Global Mirror relationship, run the `mkrcrelationship` command with the `-global` parameter.
For example, enter:

```
mkrcrelationship -master master_volume_id  
-aux aux_volume_id -cluster system_id -global
```

Where *master_volume_id* is the ID of the master volume, *aux_volume_id* is the ID of the auxiliary volume, and *system_id* is the ID of the remote system.

3. To create a new relationship with cycling enabled:

```
mkrcrelationship -master books_volume -aux books_volume -cluster DR_cluster -global -  
cyclingmode multi
```

Note: Add change volumes to a relationship by issuing **chrcrelationship -auxchange** or **chrcrelationship -masterchange**.

4. To create a new active-active relationship, run the `mkrcrelationship` command with the `-activeactive` parameter.
For example, enter the following command:

```
mkrcrelationship -master master_volume_id -aux aux_volume_id -cluster system_id -activeactive
```

Where *master_volume_id* is the ID of the master volume, *aux_volume_id* is the ID of the auxiliary volume, and *system_id* is the ID of the remote system.

Modifying Metro Mirror, Global Mirror, or active-active relationships by using the CLI

You can use the command-line interface (CLI) to modify certain attributes of Metro Mirror, Global Mirror, or active-active relationships. You can change only one attribute at a time for each command submission.

About this task

To modify Metro Mirror, Global Mirror, or active-active relationships, run the `chrcrelationship` command.

Procedure

Run the `chrcrelationship` command to change the name of a Metro Mirror, Global Mirror, or active-active relationship.

For example, to change the relationship name, enter:

```
chrcrelationship -name new_rc_rel_name previous_rc_rel_name
```

Where *new_rc_rel_name* is the new name of the relationship and *previous_rc_rel_name* is the previous name of the relationship.

Or, run the `chrcrelationship` command to remove a relationship from whichever consistency group it is a member of. For example, enter the following command:

```
chrcrelationship -force -noconsistgrp rc_rel_name/id
```

Where *rc_rel_name/id* is the name or ID of the relationship.

Important: Using the **-force** parameter might result in a loss of access. Use it only under the direction of your support center.

Starting and stopping Metro Mirror, Global Mirror, or active-active relationships by using the CLI

You can use the command-line interface (CLI) to start and stop stand-alone Metro Mirror, Global Mirror, or active-active relationships. Relationships that are members of consistency groups must be started and stopped by using the consistency group CLI commands.

About this task

Complete these steps to start or stop Metro Mirror, Global Mirror or active-active relationships:

Note: Avoid concurrent service actions that affect the same remote-copy relationship or consistency group in multiple clustered systems. Where possible, run command-line interface (CLI) commands, including scripted CLI commands, on each clustered system sequentially. Running commands sequentially ensures that no single relationship or consistency group is processing concurrent commands from multiple sources.

Procedure

1. To start a Metro Mirror, Global Mirror, or an active-active relationship, run the `starttrrelationship` command.
For example, enter the following command:

```
starttrrelationship rc_rel_id
```

Where *rc_rel_id* is the ID of the relationship that you want to start in a stand-alone relationship.

Note: Active-active relationships can be started only if they have a state of idling.

When you restart a Metro Mirror, Global Mirror, or an active-active relationship, you can determine the previous copy direction from the `previous_primary` attribute that is displayed by using the **lsrcrelationship** command.

2. To stop a Metro Mirror or Global Mirror relationship, run the `stoprcrelationship` command. This command applies to a stand-alone relationship.

For example, enter the following command:

```
stoprcrelationship rc_rel_id
```

Where `rc_rel_id` is the ID of the stand-alone relationship that you want to stop mirroring I/O.

3. To stop an active-active relationship, the following conditions must be met:

- The **-access** parameter is specified.
- The state of the relationship is **consistent_copying**.
- The status of the relationship is **primary_offline**.

For example, enter the following command:

```
stoprcrelationship rc_rel_id -access
```

Where `rc_rel_id` is the ID of the active-active relationship that you want to stop. The **-access** parameter gives hosts read or write access to a volume in an active-active relationship that contains an older but a consistent image that can be used in a disaster recovery scenario.

4. To restart a Metro Mirror or a Global Mirror relationship in the idling state, run the `startrcrelationship` command. You must use the **-primary** parameter to specify the copy direction if the relationship was stopped using the **-access** parameter. To determine the copy direction before the relationship was stopped, run the `lsrcrelationship` command. The `previous_primary` field indicates which volume was the primary (source) volume for the relationship before the relationship was stopped. When the relationship is in the idling state, the value is either *master* or *aux*. For active-active relationships which are part of a HyperSwap volume the `previous_primary` field is not used and the value is blank.
For example, to restart a relationship that has been stopped using the **-access** parameter, enter the following command:

```
startrcrelationship -primary rc_copy_direction rc_rel_id
```

Where `rc_copy_direction` is the value for the primary (source) volume and `rc_rel_id` is the ID of the relationship that you want to start in a stand-alone relationship.

Displaying the progress of Metro Mirror, Global Mirror, or active-active relationships by using the CLI

You can use the command-line interface (CLI) to display the background copy of Metro Mirror, Global Mirror, or active-active relationships as a percentage. When the initial background copy process for a relationship is completed, `null` is displayed for the progress of that relationship.

About this task

To display the progress of the background copy of Metro Mirror, Global Mirror, or active-active relationships, run the `lsrcrelationshipprogress` command.

Procedure

1. To display data progress without headings for columns of data or for each item of data in a Metro Mirror, Global Mirror, or active-active relationship, run the `lsrcrelationshipprogress -nohdr` command.

For example, to display data of the relationship with headings suppressed, enter the following command, where *rc_rel_name* is the name of the specified object type.

```
lsrcrelationshipprogress -nohdr rc_rel_name
```

2. To display the progress of a background copy of a Metro Mirror, Global Mirror, or active-active relationship as a percentage, run the `lsrcrelationshipprogress -delim` command. The colon character (:) separates all items of data in a concise view, and the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter. For example, enter the following command:

```
lsrcrelationshipprogress -delim : 0
```

The resulting output is displayed, such as in this example:

```
id:progress
0:58
```

Switching Metro Mirror or Global Mirror relationships using the CLI

You can use the command-line interface (CLI) to reverse the roles of primary and secondary volumes in a stand-alone Metro Mirror or Global Mirror relationship when that relationship is in a consistent state. You cannot switch roles between primary and secondary volumes for active-active relationships.

About this task

Relationships that are members of consistency groups must be switched by using the consistency group CLI commands. To switch the roles of primary and secondary volumes in Metro Mirror or Global Mirror relationships, follow these steps:

Procedure

1. To make the master disk in a Metro Mirror or Global Mirror relationship to be the primary, run the `switchrcrelationship -primary master` command. For example, enter:

```
switchrcrelationship -primary master rc_rel_id
```

Where *rc_rel_id* is the ID of the relationship to switch.

2. To make the auxiliary disk in a Metro Mirror or Global Mirror relationship to be the primary, run the `switchrcrelationship -primary aux` command. For example, enter:

```
switchrcrelationship -primary aux rc_rel_id
```

Where *rc_rel_id* is the ID of the relationship to switch.

Remember:

- You cannot switch a global relationship if cycling is (automatically) set.
- To switch the direction of a **multi** cycling mode-based relationship, the relationship must stop with access enabled. Then, start by using **-force** in the opposite direction. (Using the **force** parameter might result in a loss of access. Use it only under the direction of your support center.)

Deleting Metro Mirror, Global Mirror, or active-active relationships by using the CLI

You can use the command line interface (CLI) to delete Metro Mirror, Global Mirror, or active-active relationships.

Procedure

To delete Metro Mirror, Global Mirror, or active-active relationships, run the `rmicrelationship` command.

For example, enter the following command:

```
rmicrelationship rc_rel_name/id
```

Where `rc_rel_name/id` is the name or ID of the relationship.

Creating Metro Mirror, Global Mirror, or active-active consistency groups by using the CLI

You can use the command-line interface (CLI) to create Metro Mirror, Global Mirror, or active-active consistency groups.

About this task

To create Metro Mirror, Global Mirror, or active-active consistency groups, complete these steps:

Procedure

1. To create a Metro Mirror, Global Mirror, or active-active consistency group, run the `mkricconsistgrp` command.

For example, enter the following command:

```
mkricconsistgrp -name new_name -cluster cluster_id
```

where `new_name` is the name of the new consistency group and `cluster_id` is the ID of the remote cluster for the new consistency group. If `-cluster` is not specified, a consistency group is created only on the local cluster. The new consistency group does not contain any relationships and is in the empty state.

2. To add Metro Mirror, Global Mirror, or active-active relationships to the group, run the `chrcrelationship` command.

For example, enter the following command:

```
chrcrelationship -consistgrp consist_group_name rc_rel_id
```

where `consist_group_name` is the name of the new consistency group to assign the relationship to and `rc_rel_id` is the ID of the relationship.

Modifying Metro Mirror, Global Mirror, or active-active consistency groups by using the CLI

You can use the command-line interface (CLI) to assign a new name or modify the name of an existing Metro Mirror, Global Mirror, or active-active consistency group.

About this task

To assign or modify the name of a Metro Mirror, Global Mirror, or active-active consistency group, run the `chrcconsistgrp` command.

Procedure

1. Run the `chrcconsistgrp` command to assign a new name to the consistency group.

For example, enter the following command:

```
chrcconsistgrp -name new_name_arg
```

where *new_name_arg* is the assigned new name of the consistency group.

2. Run the `chrcconsistgrp` command to change the name of the consistency group.
For example, enter the following command:

```
chrcconsistgrp -name new_consist_group_name previous_consist_group_name
```

where *new_consist_group_name* is the assigned new name of the consistency group and *previous_consist_group_name* is the previous name of the consistency group.

Starting and stopping Metro Mirror, Global Mirror, or active-active consistency-group copy processes by using the CLI

You can use the command-line interface (CLI) to start and stop Metro Mirror, Global Mirror, or active-active consistency-group copy processes.

About this task

Complete these steps to start and stop Metro Mirror, Global Mirror, or active-active consistency-group copy processes.

Note: Avoid concurrent service actions that affect the same remote-copy relationship or consistency group in multiple clustered systems. Where possible, run command-line interface (CLI) commands, including scripted CLI commands, on each clustered system sequentially. Running commands sequentially ensures that no single relationship or consistency group is processing concurrent commands from multiple sources.

Procedure

1. To start a Metro Mirror, Global Mirror, or active-active consistency-group copy process, set the direction of copy if it is undefined and optionally mark the secondary volumes of the consistency group as clean. Run the `startrcconsistgrp` command.
For example, enter the following command:

```
startrcconsistgrp rc_consist_group_id
```

where *rc_consist_group_id* is the ID of the consistency group to start processing.

Note: If you are starting an active-active consistency group, all relationships in the group must be in the **idling** state for the consistency group to start.

When you restart a Metro Mirror, Global Mirror, or an active-active consistency-group copy process, you can determine the previous copy direction from the `previous_primary` attribute that is displayed by using the `lsrcconsistgrp` command.

2. To stop the copy process for a Metro Mirror or Global Mirror consistency group, run the `stoprcconsistgrp` command.

For example, enter the following command:

```
stoprcconsistgrp rc_consist_group_id
```

Where *rc_consist_group_id* is the ID of the consistency group that you want to stop processing.

If the group is in a consistent state, you can also use this command to enable write access to the secondary volumes in the group.

3. To stop the copy process for an active-active consistency group, the following conditions must be met:
 - The **-access** parameter is specified.
 - The state of the relationships in the consistency group is **consistent_copying**.

- The status of the relationships in the consistency group is **primary_offline**.

For example, enter the following command:

```
stoprcconsistgrp rc_consist_group_id -access
```

Where *rc_rel_id* is the ID of the active-active consistency group that you want to stop. The **-access** parameter gives hosts read or write access to a volume in an active-active relationship that contains an older but a consistent image that can be used in a disaster recovery scenario.

4. To restart a Metro Mirror or a Global Mirror consistency-group copy process in the idling state, run the `startrcconsistgrp` command. You must use the **-primary** parameter to specify the copy direction if the consistency-group copy process was stopped using the **-access** parameter. To determine the copy direction before the consistency-group copy process was stopped, run the **lsrconsistgrp** command. The `previous_primary` field indicates which consistency-group was the primary (source) consistency-group for the copy process before the consistency-group copy process was stopped. When the consistency-group copy process is in the idling state, the value is either *master* or *aux*. For active-active consistency-group copy processes which are part of a HyperSwap volume the `previous_primary` field is not used and the value is blank. For example, to restart a consistency-group copy process that has been stopped using the **-access** parameter, enter the following command:

```
startrcconsistgrp -primary rc_copy_direction rc_consist_group_id
```

Where *rc_copy_direction* is the value for the primary (source) consistency-group and *rc_consist_group_id* is the ID of the consistency group to start processing.

Deleting Metro Mirror, Global Mirror, or active-active consistency groups by using the CLI

You can use the command-line interface (CLI) to delete Metro Mirror, Global Mirror, or active-active consistency groups.

About this task

To delete existing Metro Mirror, Global Mirror, or active-active consistency groups, complete these steps:

Procedure

1. To delete a Metro Mirror, Global Mirror, or active-active consistency group, run the `rmrcconsistgrp` command.
For example, enter the following command:

```
rmrcconsistgrp rc_consist_group_id
```

Where *rc_consist_group_id* is the ID of the consistency group to delete.

2. If a Metro Mirror, Global Mirror, or active-active consistency group is not empty, you must use the **-force** parameter to delete the consistency group.
For example, enter the following command:

```
rmrcconsistgrp -force rc_consist_group_id
```

Where *rc_consist_group_id* is the ID of the consistency group to delete. This command causes all relationships that are members of the deleted group to become stand-alone relationships.

Important: Using the **force** parameter might result in a loss of access. Use it only under the direction of your support center.

Creating Metro Mirror and Global Mirror partnerships by using the CLI

You can use the command-line interface (CLI) to create Metro Mirror and Global Mirror partnerships between two clusters.

Procedure

Note: When remote copy partnerships are created between systems that support different maximum numbers of volumes, then the maximum number of volumes that can be created on any system is determined to be the same as on the system that supports the smallest maximum number of volumes. If one system has more disks than is supported by the other system, the attempt to create a partnership fails.

To create Metro Mirror and Global Mirror partnerships, complete the following steps.

1. To create Metro Mirror and Global Mirror partnerships for Fibre Channel connections, run the **mkfcpartnership** command. To create Metro Mirror and Global Mirror partnerships for IP connections, run the **mkippartnership** command.

For example, for Fibre Channel connections enter the following command:

```
mkfcpartnership -linkbandwidthmbits bandwidth_in_mbps
                -backgroundcopyrate percentage_of_available_bandwidth remote_cluster_id
```

where *bandwidth_in_mbps* specifies the bandwidth (in megabytes per second) that is used by the background copy process between the clusters, *percentage_of_available_bandwidth* specifies the maximum percentage of aggregate link bandwidth that can be used for background copy operations, and *remote_cluster_id* is the ID of the remote system. For IP connections, enter the following command:

```
mkippartnership -type ip_address_type
                -clusterip remote_cluster_ip_address
                -chapsecret chap_secret
                -linkbandwidthmbits bandwidth_in_mbps
                -backgroundcopyrate percentage_of_available_bandwidth
```

where *ip_address_type* specifies the IP address type (IPv4 or IPv6) that is used by the background copy process between the clusters, *remote_cluster_ip_address* specifies the IP address of the remote system, *chap_secret* specifies the CHAP secret of the remote system (optional), *bandwidth_in_mbps* specifies the bandwidth (in megabytes per second) that is used by the background copy process between the clusters, and *percentage_of_available_bandwidth* specifies the maximum percentage of aggregate link bandwidth that can be used for background copy operations (optional).

2. Run the **mkfcpartnership** command for Fibre Channel connections or **mkippartnership** command for IP connections from the remote system.

For example, for Fibre Channel connections enter the following command:

```
mkfcpartnership -linkbandwidthmbits bandwidth_in_mbps
                -backgroundcopyrate percentage_of_available_bandwidth
                partner_cluster_id
```

where *bandwidth_in_mbps* specifies the bandwidth (in megabytes per second) that is used by the background copy process between the clusters, *percentage_of_available_bandwidth* specifies the maximum percentage of aggregate link bandwidth that can be used for background copy operations, and *partner_cluster_id* is the ID of the partner system (the local system in the previous step).

For Internet Protocol (IP) connections, enter the following command:

```
mkippartnership -type ip_address_type
                -clusterip partner_cluster_ip_address
                -chapsecret chap_secret
                -linkbandwidthmbits bandwidth_in_mbps
                -backgroundcopyrate percentage_of_available_bandwidth
```

where *ip_address_type* specifies the IP address type (IPv4 or IPv6) that is used by the background copy process between the clusters, *partner_cluster_ip_address* specifies the IP address of the partner

system, *chap_secret* specifies the CHAP secret of the partner system (optional), *bandwidth_in_mbps* specifies the bandwidth (in megabytes per second) that is used by the background copy process between the clusters, and *percentage_of_available_bandwidth* specifies the maximum percentage of aggregate link bandwidth that can be used for background copy operations (optional). The partner system is the local system from the previous step.

Modifying Metro Mirror and Global Mirror partnerships using the CLI

You can use the command-line interface (CLI) to modify Metro Mirror and Global Mirror partnerships.

About this task

The partnership bandwidth, which is also known as *background copy*, controls the rate at which data is sent from the local system to the remote system. The partnership bandwidth can be changed to help manage the use of intersystem links. It is measured in megabytes per second (MBps).

Complete the following steps to modify Metro Mirror and Global Mirror partnerships:

Procedure

1. To modify Metro Mirror and Global Mirror partnerships, run the **chpartnership** command.
For example, enter:

```
chpartnership -type ip_address_type
               -clusterip remote_cluster_ip_address
               -chapsecret chap_secret
               -nochapsecret -linkbandwidthmbits bandwidth_in_mbps
               -backgroundcopyrate percentage_of_available_bandwidth remote_cluster_id
```

where *ip_address_type* specifies the IP address type ("ipv4" or "ipv6") that is used by the background copy process between the clusters (only used for IP connections), *remote_cluster_ip_address* specifies the IP address of the remote cluster (only used for IP connections), *chap_secret* specifies the CHAP secret of the remote cluster (only used for IP connections), *bandwidth_in_mbps* specifies the bandwidth (in megabytes per second) that is used by the background copy process between the clusters (this is optional), *percentage_of_available_bandwidth* specifies the maximum percentage of aggregate link bandwidth that can be used for background copy operations (this is optional), and *remote_cluster_id* is the ID or name of the remote system.

2. Run the **chpartnership** command from the remote system.
For example, enter:

```
chpartnership -type ip_address_type
               -clusterip local_cluster_ip_address
               -chapsecret chap_secret -nochapsecret
               -linkbandwidthmbits bandwidth_in_mbps
               -backgroundcopyrate percentage_of_available_bandwidth local_cluster_id
```

where *ip_address_type* specifies the IP address type ("ipv4" or "ipv6") that is used by the background copy process between the clusters (only used for IP connections), *local_cluster_ip_address* specifies the IP address of the local cluster (only used for IP connections), *chap_secret* specifies the CHAP secret of the local cluster (only used for IP connections), *bandwidth_in_mbps* specifies the bandwidth (in megabytes per second) that is used by the background copy process between the clusters (this is optional), *percentage_of_available_bandwidth* specifies the maximum percentage of aggregate link bandwidth that can be used for background copy operations (this is optional), and *local_cluster_id* is the ID or name of the local system.

Starting and stopping Metro Mirror and Global Mirror partnerships using the CLI

You can use the command-line interface (CLI) to start and stop Metro Mirror and Global Mirror partnerships.

About this task

Complete the following steps to start and stop Metro Mirror and Global Mirror partnerships:

Procedure

1. To start a Metro Mirror or Global Mirror partnership, run the `chpartnership` command from either cluster.
For example, enter:

```
chpartnership -start cluster_id
```

Where *cluster_id* is the ID of the local or remote cluster. The **mkfcppartnership** or **mkippartnership** command starts the partnership by default.

2. To stop a Metro Mirror or Global Mirror partnership, run the `chpartnership` command from either cluster.
For example, enter:

```
chpartnership -stop cluster_id
```

Where *cluster_id* is the ID of the local or remote cluster.

Deleting Metro Mirror and Global Mirror partnerships using the CLI

You can use the command-line interface (CLI) to delete Metro Mirror and Global Mirror partnerships.

About this task

Complete the following steps to delete Metro Mirror and Global Mirror partnerships:

Procedure

1. If a Metro Mirror or Global Mirror partnership has configured relationships or groups, you must stop the partnership before you can delete it.
For example, enter:

```
chpartnership -stop remote_cluster_id
```

Where *remote_cluster_id* is the ID of the remote cluster.

2. To delete a Metro Mirror and Global Mirror partnership, run the `impartnership` command from either cluster.
For example, enter:

```
impartnership remote_cluster_id
```

Where *remote_cluster_id* is the ID of the remote cluster.

Determining the WWNNs of a node using the CLI

You can determine the worldwide node names (WWNNs) of a node using the command-line interface (CLI).

About this task

Perform the following steps to determine the WWNNs of a node:

Procedure

1. Issue the **lsnode** CLI command to list the nodes in the clustered system.
2. Record the name or ID of the node for which you want to determine the WWNNs.
3. Issue the **lsportfc** CLI command and specify the node name or ID that was recorded in step “2” on [page 49](#).

Here is an example of the CLI command you can issue:

```
lsportfc -filtervalue node_id=2
```

Where `node_id=2` is the name of the node for which you want to determine the WWNNs. The output from the command is:

id	fc_io_port_id	port_id	type	port_speed	node_id	node_name	WWNN	port_id	status
0	1	1	fc	8 Gb	2	node2	5005076801405F82	010E00	active
1	2	2	fc	8 Gb	2	node2	5005076801305F82	010A00	active
2	3	3	fc	8 Gb	2	node2	5005076801105F82	010E00	active
3	4	4	fc	8 Gb	2	node2	5005076801205F82	10A00	active
4	5	3	ethernet	10 Gb	2	node2	5005076801505F82	540531	active
5	6	4	ethernet	10 Gb	2	node2	5005076801605F82	E80326	active

- Record the six WWNNs (to assist with setting up other systems).

Listing node-dependent volumes using the CLI

You can use the command-line interface (CLI) to list the volumes that are dependent on the status of a node.

Before you begin

If a node goes offline or is removed from a system, all volumes that are dependent on the node go offline. Before taking a node offline or removing a node from a system, run the **lsdependentvdisks** command to identify any node-dependent volumes.

About this task

By default, the **lsdependentvdisks** command also checks all available quorum disks. If the quorum disks are accessible only through the specified node, the command returns an error.

Various scenarios can produce node-dependent volumes. The following examples are common scenarios in which the **lsnodedependentvdisks** command will return node-dependent volumes:

- The node contains flash drives the only synchronized copy of a mirrored volume.
- The node is the only node that can access an MDisk on the SAN fabric.
- The other node in the I/O group is offline (all volumes in the I/O group are returned).
- Pinned data in the cache is stopping the partner node from joining the I/O group.

To resolve (1), allow volume mirror synchronizations between Flash drive MDisk to complete. To resolve (2-4), bring any offline MDisk online and repair any degraded paths.

Note: The command lists the node-dependent volumes at the time the command is run; subsequent changes to a system require running the command again.

Procedure

- Issue the **lsdependentvdisks** CLI command.

The following example shows the CLI format for listing the volumes that are dependent on node01:

```
lsdependentvdisks -enclosure -delim : 0:1
```

The following example shows the output that is displayed:

```
vdisk_id:vdisk_name
4:vdisk4
5:vdisk5
```

2. If the **lsdependentvdisks** command returns an error, you must move your quorum disks to MDiskS that are accessible through all nodes.

Rerun the command until no errors are returned.

3. Reissue the **lsdependentvdisks** command.

When the command returns no volumes, the system is free from any node-dependent volumes.

The following example shows the command syntax for listing the volumes that are dependent on node01:

```
lsdependentvdisks -delim : -node node01 :
```

The following example shows the command output if there are no node-dependent volumes in the system:

```
vdisk_id      vdisk_name
```

Determining the volume name from the device identifier on the host

You can use the command-line interface (CLI) to determine the volume name from the device identifier on the host.

About this task

Each volume that is exported by the system is assigned a unique device identifier. The device identifier uniquely identifies the volume and can be used to determine which volume corresponds to the volume that the host detects.

Complete the following steps to determine the volume name from the device identifier:

Procedure

1. Find the device identifier.

For example, if you are using the subsystem device driver (SDD), the disk identifier is referred to as the virtual path (vpath) number. You can issue the following SDD command to find the vpath serial number:

```
datapath query device
```

For other multipathing drivers, refer to the documentation that is provided with your multipathing driver to determine the device identifier.

2. Find the host object that is defined to the system and corresponds with the host that you are working with.

- a) Find the worldwide port numbers (WWPNs) by looking at the device definitions that are stored by your operating system.
For example, on AIX the WWPNs are in the ODM and if you use Windows you must go into the HBA BIOS.

- b) Verify which host object is defined to the system for which these ports belong. The ports are stored as part of the detailed view so that you must list each host by issuing the following CLI command:

```
lshost id / name
```

Where *id / name* is the name or ID of the host.

- c) Check for matching WWPNs.
3. Enter the following command to list the host mappings:

```
lshostvdiskmap hostname
```

Where *hostname* is the name of the host.

4. Find the volume UID that matches the device identifier and record the volume name or ID.

Determining the host that a volume maps

You can determine the host that a volume maps by using the command-line interface (CLI). To view the host mapping for a volume in the management GUI, select **Volumes > Volumes by Hosts**.

About this task

Complete the following steps to determine the host that the volume maps:

Procedure

1. Enter the following CLI command to list the hosts to which this volume maps:

```
lsdiskhostmap vdisk_name | vdisk_id
```

Where *vdisk_name* / *vdisk_id* is the name or ID of the volume.

2. Find the host name or ID to determine which host this volume maps.
- If no data is returned, the volume does not map any hosts.

Determining the relationship between volume and MDisks using the CLI

You can determine the relationship between volumes and managed disks (MDisks) using the command-line interface (CLI).

About this task

Select one or more of the following options to determine the relationship between volumes and MDisks:

Procedure

- To display a list of the IDs that correspond to the MDisks that comprise the volume, issue the following CLI command:

```
lsdiskmember vdiskname/id
```

where *vdiskname/id* is the name or ID of the volume.

- To display a list of IDs that correspond to the volumes that are using this MDisk, issue the following CLI command:

```
lsmdiskmember mdiskname/id
```

where *mdiskname/id* is the name or ID of the MDisk.

- To display a table of volume IDs and the corresponding number of extents that are being used by each volume, issue the following CLI command:

```
lsmdiskextent mdiskname/id
```

where *mdiskname/id* is the name or ID of the MDisk.

- To display a table of MDisk IDs and the corresponding number of extents that each MDisk provides as storage for the specified volume, issue the following CLI command:

```
lsvdiskextent vdiskname/id
```

where *vdiskname/id* is the name or ID of the volume.

Determining the relationship between MDisks and controller LUNs using the CLI

You can determine the relationship between managed disks (MDisks) and RAID arrays or LUNs using the command-line interface (CLI).

About this task

Each MDisk corresponds with a single RAID array, or with a single partition on a specified RAID array. Each RAID controller defines a LUN number for this disk. The LUN number and controller name or ID are needed to determine the relationship between MDisks and RAID arrays or partitions.

Complete the following steps to determine the relationship between MDisks and RAID arrays:

Procedure

1. Enter the following command to display a detailed view of the MDisk:

```
lsmdisk object_name
```

Where *object_name* is the name of the MDisk for which you want to display a detailed view.

2. Record the controller name or controller ID and the controller LUN number.
3. Enter the following command to display a detailed view of the controller:

```
lscontroller controller_name
```

Where *controller_name* is the name of the controller that you recorded in step “2” on page 53.

4. Record the vendor ID, product ID, and WWNN. You can use this information to determine what is being presented to the MDisk.
5. From the native user interface for the specified controller, list the LUNs it is presenting and match the LUN number with that noted in step “1” on page 53. This provides the exact RAID array or partition that corresponds with the MDisk.

Increasing the size of your system by using the CLI

You can increase the size of the system by adding more nodes. The nodes must be added in pairs and assigned to a new I/O group.

About this task

Complete the following steps to increase the size of your system:

Procedure

1. Add a node to your system and repeat this step for the second node.
2. Migrate your volumes to new I/O groups if you want to balance the load between the existing I/O groups and the new I/O groups. Repeat this step for all volumes that you want to assign to the new I/O group.

Adding a node or enclosure to increase the size of the system

You can add a node to the system by using the CLI or management GUI. A node can be added to the system if the node previously failed and is being replaced with a new node or if a repair action causes the node to be unrecognizable by the system. When you add nodes, ensure that they are added in pairs to

create a full I/O group. Adding a node to the system typically increases the capacity of the entire system. Adding spare nodes to a system does not increase the capacity of the system.

You can use either the management GUI or the command-line interface to add a node to the system. Some models might require you to use the front panel to verify that the new node was added correctly.

Before you add a node to a system, you must make sure that the switch zoning is configured such that the node that is being added is in the same zone as all other nodes in the system. If you are replacing a node and the switch is zoned by worldwide port name (WWPN) rather than by switch port, make sure that the switch is configured such that the node that is being added is in the same VSAN or zone.

Note: Use a consistent method (either only the management GUI, or only the CLI) when you add, remove, and re-add nodes. If a node is added by using the CLI and later re-added by using the GUI, it might get a different node name than it originally had.

Rules and restrictions for adding a node to a system

If you are using hot-spare nodes, the following considerations might not all be applicable. For more information, see the topic on adding a hot-spare node and the **swapnode** command.

If you are adding a node that was used previously, either within a different I/O group within this system or within a different system, if you add a node without changing its worldwide node name (WWNN), hosts might detect the node and use it as if it were in its old location. This action might cause the hosts to access the wrong volumes.

- You must ensure that the model type of the new node is supported by the software level that is installed on the system. If the model type is not supported by the software level, update the system to a software level that supports the model type of the new node.
- Each node in an I/O group must be connected to a different uninterruptible power supply.
- If you are adding a node back to the same I/O group after a service action required it to be deleted from the system, and if the physical node did not change, then no special procedures are required to add it back to the system.
- If you are replacing a node in a system either because of a node failure or an update, you must change the WWNN of the new node to match that of the original node before you connect the node to the Fibre Channel network and add the node to the system.
- If you are adding a node to the network again, to avoid data corruption, ensure that you are adding the node to the same I/O group from which it was removed. You must use the information that was recorded when the node was originally added to the system. If you do not have access to this information, contact the support center for assistance with adding the node back into the system so that data is not corrupted.
- For each external storage system, the LUNs that are presented to the ports on the new node must be the same as the LUNs that are presented to the nodes that currently exist in the system. You must ensure that the LUNs are the same before you add the new node to the system.
- If you create an I/O group in the system and add a node, no special procedures are needed because this node was never added to a system.
- If you create an I/O group in the system and add a node that was added to a system before, the host system might still be configured to the node WWPNs and the node might still be zoned in the fabric. Because you cannot change the WWNN for the node, you must ensure that other components in your fabric are configured correctly. Verify that any host that was previously configured to use the node was correctly updated.
- If the node that you are adding was previously replaced, either for a node repair or update, you might use the WWNN of that node for the replacement node. Ensure that the WWNN of this node was updated so that you do not have two nodes with the same WWNN attached to your fabric. Also, ensure that the WWNN of the node that you are adding is not 00000. If it is 00000, contact your support representative.
- The new node must be running a software level that supports encryption.
- If you are adding the new node to a system with either a HyperSwap or stretched system topology, you must assign the node to a specific site.

Rules and restrictions for using multipathing device drivers

- Applications on the host systems direct I/O operations to file systems or logical volumes that are mapped by the operating system to virtual paths (*vpaths*), which are pseudo disk objects that are supported by the multipathing device drivers. Multipathing device drivers maintain an association between a *vpath* and a volume. This association uses an identifier (UID) which is unique to the volume and is never reused. The UID allows multipathing device drivers to directly associate *vpaths* with volumes.
- Multipathing device drivers operate within a protocol stack that contains disk and Fibre Channel device drivers that are used to communicate with the system by using the SCSI protocol over Fibre Channel as defined by the ANSI FCS standard. The addressing scheme that is provided by these SCSI and Fibre Channel device drivers uses a combination of a SCSI logical unit number (LUN) and the worldwide node name (WWNN) for the Fibre Channel node and ports.
- If an error occurs, the error recovery procedures (ERPs) operate at various tiers in the protocol stack. Some of these ERPs cause I/O to be redriven by using the same WWNN and LUN numbers that were previously used.
- Multipathing device drivers do not check the association of the volume with the *vpath* on every I/O operation that it performs.

You can use either the **addnode** command or the **Add Node** wizard in the management GUI. To access the **Add Node** wizard, select **Monitoring > System**. On the **System -- Overview** page, select **Add Node** to start the wizard. Complete the wizard and verify the new node. If **Add Node** is not displayed, it indicates a potential cabling issue. Check the installation information to ensure that your node was cabled correctly.

To add a node to a system by using the command-line interface, complete these steps:

1. Enter this command to verify that the node is detected on the network:

```
svcinfolsnodecandidate
```

If the node is detected on the system the results display information identifying the new node in the system, like the serial number and machine signature. The **id** parameter displays the WWNN for the node. If the node is not detected, verify cabling to the node.

2. Enter this command to determine the I/O group where the node must be added:

```
lsiogrp
```

3. Record the name or ID of the first I/O group that has a node count of zero. You need the name or ID for the next step. Note: You must do this step for the first node that is added. You do not do this step for the second node of the pair because it uses the same I/O group number.
4. Enter this command to add the node to the system:

```
addnode -wwnodename WWNN -iogrp iogrp_name -name new_name_arg -site site_name
```

Where **WWNN** is the WWNN of the node, **iogrp_name** is the name of the I/O group that you want to add the node to and **new_name_arg** is the name that you want to assign to the node. If you do not specify a new node name, a default name is assigned. Typically, you specify a meaningful node name. The **site_name** specifies the name of the site location of the new node. This parameter is only required if the topology is a HyperSwap or stretched system.

Note: Adding the node might take a considerable amount of time.

5. Record this information for future reference:

- Serial number.
- Worldwide node name.
- All of the worldwide port names.
- The name or ID of the I/O group

Validating and repairing mirrored volume copies by using the CLI

You can use the **repairvdiskcopy** command from the command-line interface (CLI) to validate and repair mirrored volume copies.

Attention: Run the **repairvdiskcopy** command only if all volume copies are synchronized.

When you issue the **repairvdiskcopy** command, you must use only one of the **-validate**, **-medium**, or **-resync** parameters. You must also specify the name or ID of the volume to be validated and repaired as the last entry on the command line. After you issue the command, no output is displayed.

-validate

Use this parameter only if you want to verify that the mirrored volume copies are identical. If any difference is found, the command stops and logs an error that includes the logical block address (LBA) and the length of the first difference. You can use this parameter, starting at a different LBA each time to count the number of differences on a volume.

-medium

Use this parameter to convert sectors on all volume copies that contain different contents into virtual medium errors. Upon completion, the command logs an event, which indicates the number of differences that were found, the number that were converted into medium errors, and the number that were not converted. Use this option if you are unsure what the correct data is, and you do not want an incorrect version of the data to be used.

-resync

Use this parameter to overwrite contents from the specified primary volume copy to the other volume copy. The command corrects any differing sectors by copying the sectors from the primary copy to the copies that are being compared. Upon completion, the command process logs an event, which indicates the number of differences that were corrected. Use this action if you are sure that either the primary volume copy data is correct or that your host applications can handle incorrect data.

-startlba lba

Optionally, use this parameter to specify the starting Logical Block Address (LBA) from which to start the validation and repair. If you previously used the **validate** parameter, an error was logged with the LBA where the first difference, if any, was found. Reissue **repairvdiskcopy** with that LBA to avoid reprocessing the initial sectors that compared identically. Continue to reissue **repairvdiskcopy** by using this parameter to list all the differences.

Issue the following command to validate and, if necessary, automatically repair mirrored copies of the specified volume:

```
repairvdiskcopy -resync -startlba 20 vdisk8
```

Notes:

1. Only one **repairvdiskcopy** command can run on a volume at a time.
2. After you start the **repairvdiskcopy** command, you cannot use the command to stop processing.
3. The primary copy of a mirrored volume cannot be changed while the **repairvdiskcopy -resync** command is running.
4. If there is only one mirrored copy, the command returns immediately with an error.
5. If a copy that is being compared goes offline, the command is halted with an error. The command is not automatically resumed when the copy is brought back online.
6. In the case where one copy is readable but the other copy has a medium error, the command process automatically attempts to fix the medium error by writing the read data from the other copy.
7. If no differing sectors are found during **repairvdiskcopy** processing, an informational error is logged at the end of the process.

Checking the progress of validation and repair of volume copies by using the CLI

Use the **lsrepairvdiskcopyprogress** command to display the progress of mirrored volume validation and repairs. You can specify a volume copy by using the **-copy id** parameter. To display the volume that has two or more copies with an active task, specify the command with no parameters; it is not possible to have only one volume copy with an active task.

To check the progress of validation and repair of mirrored volumes, issue the following command:

```
lsrepairvdiskcopyprogress -delim :
```

The following example shows how the command output is displayed:

```
vdisk_id:vdisk_name:copy_id:task:progress:estimated_completion_time
0:vdisk0:0:medium:50:070301120000
0:vdisk0:1:medium:50:070301120000
```

Repairing a thin-provisioned volume using the CLI

You can use the **repairsevdiskcopy** command from the command-line interface to repair the metadata on a thin-provisioned volume.

The **repairsevdiskcopy** command automatically detects and repairs corrupted metadata. The command holds the volume offline during the repair, but does not prevent the disk from being moved between I/O groups.

If a repair operation completes successfully and the volume was previously offline because of corrupted metadata, the command brings the volume back online. The only limit on the number of concurrent repair operations is the number of volume copies in the configuration.

When you issue the **repairsevdiskcopy** command, you must specify the name or ID of the volume to be repaired as the last entry on the command line. Once started, a repair operation cannot be paused or canceled; the repair can be terminated only by deleting the copy.

Attention: Use this command only to repair a thin-provisioned volume that has reported corrupt metadata.

Issue the following command to repair the metadata on a thin-provisioned volume:

```
repairsevdiskcopy vdisk8
```

After you issue the command, no output is displayed.

Notes:

1. Because the volume is offline to the host, any I/O that is submitted to the volume while it is being repaired fails.
2. When the repair operation completes successfully, the corrupted metadata error is marked as fixed.
3. If the repair operation fails, the volume is held offline and an error is logged.

Checking the progress of the repair of a thin-provisioned volume by using the CLI

Issue the **lsrepairsevdiskcopyprogress** command to list the repair progress for thin-provisioned volume copies of the specified volume. If you do not specify a volume, the command lists the repair progress for all thin-provisioned copies in the system.

Note: Run this command only after you run the **repairsevdiskcopy** command, which you must run only as required by the fix procedures that are recommended by your support team.

Recovering offline volumes by using the CLI

If a node or an I/O group fails, you can use the command-line interface (CLI) to recover offline volumes.

About this task

If you lose both nodes in an I/O group, you lose access to all volumes that are associated with the I/O group. To regain access to the volumes, you must perform one of the following procedures. Depending on the failure type, you might have lost data that was cached for these volumes and the volumes are now offline.

Data loss scenario 1

One node in an I/O group failed and failover started on the second node. During the failover process, the second node in the I/O group fails before the data in the write cache is flushed to the backend. The first node is successfully repaired but its hardened data is not the most recent version that is committed to the data store, therefore, it cannot be used. The second node is repaired or replaced and lost its hardened data, and the node has no way of recognizing that it is part of the system.

Complete the following steps to recover an offline volume when one node has down-level hardened data and the other node loses hardened data:

Procedure

1. Recover the node and add it back into the system.
2. Delete all IBM FlashCopy mappings and Metro Mirror or Global Mirror relationships that use the offline volumes.
3. Run the **recovervdisk**, **recovervdiskbyiogrp** or **recovervdiskbysystem** command.
4. Re-create all FlashCopy mappings and Metro Mirror or Global Mirror relationships that use the volumes.

Example

Data loss scenario 2

Both nodes in the I/O group failed and have been repaired. Therefore, the nodes lost their hardened data and have no way of recognizing that they are part of the system.

Complete the following steps to recover an offline volume when both nodes that have lost their hardened data and cannot be recognized by the system:

1. Delete all FlashCopy mappings and Metro Mirror or Global Mirror relationships that use the offline volumes.
2. Run the **recovervdisk**, **recovervdiskbyiogrp** or **recovervdiskbysystem** command.
3. Re-create all FlashCopy mappings and Metro Mirror or Global Mirror relationships that use the volumes.

Recovering a node and returning it to the system by using the CLI

After a node or an I/O group fails, you can use the command-line interface (CLI) to recover a node and return it to the system.

About this task

Complete the following steps to recover a node and return it to the system:

Procedure

1. Run the **lsnode** command to verify that the node is offline.
2. Run the **rmnode nodename_or_ID** command to remove the old instance of the offline node from the system.

3. Run the **lsnodecandidate** command to verify that the node is visible on the fabric.
4. Run the **addnode** command to add the node back into the system. In the following command, *wwnn* is the worldwide node name, *iogroupname_or_ID* identifies the I/O group, and *nodename* is the name of the node.

```
addnode -wwnn wwnn -iogrp iogroupname_or_ID -name nodename
```

Note: In a service situation, a node must be added back into a system that uses the original node name. If the partner node in the I/O group was not also deleted, this name is the default name that is used if the **-name** parameter is not specified.

5. Run the **lsnode** command to verify that the node is online.

Recovering offline volumes using the CLI

You can recover offline volumes using the command-line interface (CLI).

About this task

Complete the following steps to recover offline volumes:

Procedure

1. Issue the following CLI command to list all volumes that are offline and belong to an I/O group, enter:

```
lsvdisk -filtervalue IO_group_name=  
IOGRPNAME/ID:status=offline
```

where *IOGRPNAME/ID* is the name of the I/O group that failed.

2. To acknowledge data loss for a volume with a *fast_write_state* of **corrupt** and bring the volume back online, enter:

```
recovervdisk vdisk_id | vdisk_name
```

where *vdisk_id* / *vdisk_name* is the name or ID of the volume.

Notes:

- If the specified volume is space-efficient or has space-efficient copies, the **recovervdisk** command starts the space-efficient repair process.
 - If the specified volume is mirrored, the **recovervdisk** command starts the resynchronization process.
3. To acknowledge data loss for all virtual disks in an I/O group with a *fast_write_state* of **corrupt** and bring them back online, enter:

```
recovervdiskbyiogrp io_group_id | io_group_name
```

where *io_group_id* / *io_group_name* is the name or ID of the I/O group.

Notes:

- If any volume is space-efficient or has space-efficient copies, the **recovervdiskbyiogrp** command starts the space-efficient repair process.
 - If any volume is mirrored, the **recovervdiskbyiogrp** command starts the resynchronization process.
4. To acknowledge data loss for all volumes in the clustered system with a *fast_write_state* of **corrupt** and bring them back online, enter:

```
recovervdiskbycluster
```

Notes:

- If any volume is space-efficient or has space-efficient copies, the **recovervdiskbycluster** command starts the space-efficient repair process.
- If any volume is mirrored, the **recovervdiskbycluster** command starts the resynchronization process.

Moving offline volumes to their original I/O group using the CLI

Move offline volumes to their original I/O group by using the command-line interface (CLI).

About this task

After a node or an I/O group fails, you can use the following procedure to move offline volumes to their original I/O group. The system disables moving a volume if the selected volume is formatting. After the formatting completes, you can move the volume.

Attention: Do not move volumes to an offline I/O group. Ensure that the I/O group is online before you move the volume back to avoid any further data loss.

Complete the following steps to move offline volumes to their original I/O group:

Procedure

1. Enter the following command to move the volume back into the original I/O group.

In the example, *7* is the name of the node that you want to move the volume, *IOGRP3* identifies the I/O group that you want to migrate the volume to, and *DB_volume* identifies the volume that you want to migrate.

```
movevdisk -iogrp IOGRP3 -node 7 DB_volume
```

2. Enter the following command, where *IO_grpname_or_ID* is the name or ID of the original I/O group, to verify that the volumes are now online.

```
lsdisk -filtervalue IO_group_name= IO_grpname_or_ID
```

Recording WWPN changes of replaced host HBAs

You can use the command-line interface (CLI) to record a change to a defined host object.

Before you begin

Sometimes it is necessary to replace the host-bus adapter (HBA) that connects the host to the SAN. You must inform the system of the new worldwide port names (WWPNs) that the replacement HBA contains.

Ensure that your switch is zoned correctly.

Procedure

To inform the system of a change to a defined host object, complete the following steps.

1. Enter the following CLI command to list the candidate HBA ports.

```
lsfcportcandidate
```

or

```
lssasportcandidate
```

You see a list of the HBA ports that are available for addition to host objects. One or more of these HBA ports corresponds with one or more WWPNs that belong to the new HBA port.

2. Locate the host object that corresponds with the host in which you replaced the HBA. The following CLI command lists all the defined host objects:

```
lshost
```

3. Enter the following CLI command to list the WWPNs that are currently assigned to the host object.

```
lshost hostobjectname
```

Where *hostobjectname* is the name of the host object.

4. Enter the following CLI command to add the new ports to the existing host object.

```
addhostport -fcwwpn one or more existing port names  
separated by : hostobjectname/ID
```

Where *one or more existing port names separated by :* is the WWPNs that are currently assigned to the host object and *hostobjectname/ID* is the name or ID of the host object.

5. Enter the following CLI command to remove the old ports from the host object.

```
rmhostport -fcwwpn one or more existing port names  
separated by : hostobjectname/ID
```

Where one or more existing WWPns separated by a colon (:) are the WWPns that are currently assigned to the host object and *hostobjectname/ID* is the name or ID of the host object.

Note: If the following conditions are met when volume protection is enabled for the system, the deletion of the specified host port fails.

- It is the last active port on the host.
- It is mapped to any volume that received I/O within the specified volume protection interval.

If volume protection is enabled, and the host port being deleted is the last port for a host, which is mapped to any volume that received I/O within the defined volume protection time period, then the command fails. If multiple hosts are mapped to the same active volume, the system deletes the port if the host is offline.

Results

Any mappings that exist between the host object and the volumes are automatically applied to the new WWPns. Therefore, the host sees the volumes as the same SCSI LUNs as before.

What to do next

See the *IBM Multipath Subsystem Device Driver User's Guide* or the documentation that is provided with your multipathing driver for additional information about dynamic reconfiguration.

Expanding volumes by using the CLI

You can use the command-line interface (CLI) to expand the size of a volume.

About this task

The system supports expanding the size of a volume concurrent with I/O operations, when supported by the host operating system.

You can expand volumes for the following reasons:

- To increase the available capacity on a particular volume that is already mapped to a host.
- To increase the size of a volume so that it matches the size of another volume, so that it can be used in a FlashCopy mapping or remote-copy relationship.

You can determine the exact size of a volume by issuing the following CLI command:

```
lsvdisk -bytes vdisk_name/vdisk_id
```

Where *vdisk_name* or *vdisk_id* is the name or ID of the volume.

The following types of volumes cannot be expanded:

- Volumes that are completing quick initialization. After the quick initialization completes, you can expand the volume.
- Volumes that are mapped for FlashCopy.
- Volumes in Global Mirror relationships that are operating in cycling mode.

You can expand the size of volumes in Metro Mirror and Global Mirror relationships that are in `consistent_synchronized` state. To maintain full operation of the system, you must expand both volumes in a relationship. First, expand the secondary volume by the needed capacity, and then expand the primary volume. Volumes in Metro Mirror and Global Mirror relationships cannot be expanded if any of the following conditions are true:

- Volumes are in relationships where a change volume is configured.
- Volumes are mirrored with at least one standard-provisioned copy.

You can expand the size of HyperSwap volumes if the following conditions are true:

- All copies of the volume are synchronized.
- All copies of the volume are thin-provisioned or compressed.
- No mirrored copies exist.
- The volume is not in a consistency group. To work around this limitation, you can remove the active-active relationship for the volume from the remote copy consistency group, and then expand the volume. After the volume is expanded, add the active-active relationship for the volume back to the consistency group.

Procedure

1. Enter the following CLI command to expand a non-HyperSwap volume:

```
expandvdiskspace -size disk_size -unit data_unit vdisk_name/vdisk_id
```

Where

- *disk_size* is the capacity by which you want to expand the volume.
- `b | kb | mb | gb | tb | pb` is the *data_unit* to use with the capacity.
- *vdisk_name/vdisk_id* is the name of the volume or the ID of the volume to expand.

2. Enter the following CLI command to expand a HyperSwap volume:

```
expandvolume -size disk_size -unit data_unit volume_name/volume_id
```

Where

- *disk_size* is the capacity by which you want to expand the volume.
- `b | kb | mb | gb | tb | pb` is the *data_unit* to use with the capacity.
- *volume_name/volume_id* is the name of the volume or the ID of the volume to expand.

Expanding a volume that is mapped to an AIX host

You can use the command-line interface (CLI) to expand the size of a volume that is mapped to an AIX host.

About this task

The AIX **chvg** command option can be used to expand the size of a physical volume that the Logical Volume Manager (LVM) uses. The physical volume can be expanded without interruptions to the use or availability of the system. For more information, see the *AIX System Management Guide Operating System and Devices*.

Expanding a volume that is mapped to a Microsoft Windows host by using the CLI

You can use the command-line interface (CLI) to expand the size of a volume that is mapped to a Microsoft Windows host.

About this task

After you complete the steps in “Expanding volumes by using the CLI” on page 61, start the Computer Management application and open the Disk Management window under the Storage branch.

The volume that you expanded now has some unprovisioned capacity at the end of the disk.

You can expand dynamic disks without stopping I/O operations in most cases.

What to do next

If the Computer Management application was open before you expanded the volume, use the Computer Management application to issue a rescan command.

If the disk is a Windows basic disk, you can create a new primary or extended partition from the unprovisioned capacity.

If the disk is a Windows dynamic disk, you can use the unprovisioned capacity to create a new volume (simple, striped, or mirrored) or add it to an existing volume.

Shrinking a volume using the CLI

You can reduce the capacity of a compressed or uncompressed volume by using the command-line interface (CLI).

About this task

Volumes can be reduced in capacity, if it is necessary. You can make a target or auxiliary volume the same capacity as the source or master volume when you create FlashCopy mappings, Metro Mirror relationships, or Global Mirror relationships. However, if the volume contains data, do not shrink the size of the disk. The system disables shrinking a volume if the selected volume is performing quick initialization. After the quick initialization completes, you can shrink the volume.

Attention:

1. It is difficult to anticipate how an operating system or file system uses the capacity in a volume. When you shrink a volume, capacity is removed from the end of the disk, whether or not that capacity is in use. Even if a volume has available capacity, do not assume that only unused capacity is removed when you shrink a volume.
2. If the volume contains data that is being used, *do not attempt under any circumstances to shrink a volume without first backing up your data.*
3. For performance reasons, some operating systems or file systems use the outer edge of the disk.
4. Do not shrink Global Mirror volumes or Global Mirror change volumes or run **recovervdisk**.

You can use the **shrinkvdiskspace** command to shrink the usable capacity that is provisioned to the particular volume by the specified amount. You can also shrink the provisioned capacity of a thin-provisioned volume without altering the usable capacity that is assigned to the volume.

You cannot shrink the capacity of any volume in a Global Mirror with change volumes relationship or in a HyperSwap relationship.

You can shrink the capacity of volumes in Metro Mirror and Global Mirror relationships that are in `consistent_synchronized` state. You cannot shrink the following types of volumes:

- Volumes in HyperSwap relationships or in Global Mirror relationships that are operating in cycling mode.
- Volumes in relationships where a change volume is configured.

- Mirrored volumes that have at least one standard-provisioned volume copy.

You must shrink both volumes in a relationship to maintain full operation of the system. Shrink the primary volume by the required capacity, and then shrink the secondary volume.

Procedure

Complete the following steps to shrink a volume:

1. Validate that the volume is not mapped to any host objects. If the volume is mapped, data is displayed.
2. You can determine the exact capacity of the source or master volume. Issue the following command:

`lsvdisk -bytes vdisk_name`
3. Shrink the volume by the required amount. Enter the following command, where *size_change* indicates the size reduction for the volume in the specified units and *vdisk_name* is the volume that you are shrinking.

```
shrinkvdisksize -size size_change -unit
b | kb | mb | gb | tb | pb vdisk_name
```

Migrating extents using the CLI

To improve performance, you can migrate extents using the command-line interface (CLI).

About this task

The system provides various data migration features. These features can be used to move the placement of data both *within* parent pools and *between* parent pools. These features can be used concurrently with I/O operations. You can use either of these methods to migrate data:

1. Migrating data (extents) from one MDisk to another (within the same parent pool). This method can be used to remove highly used MDisk.
2. Migrating volumes from one parent pool to another. This method can be used to remove highly used parent pools. For example, you can reduce the use of a pool of MDisk. Child pools that receive their capacity from parent pools, cannot have extents that are migrated to them.

Notes:

1. The source MDisk must not currently be the source MDisk for any other migrate extents operation.
2. The destination MDisk must not be the destination MDisk for any other migrate extents operation.

Migration commands fail if the target or source volume is offline, there is no quorum disk defined, or the defined quorum disks are unavailable. Correct the offline or quorum disk condition and reissue the command.

You can determine the use of particular MDisk by gathering input/output (I/O) statistics about nodes, MDisk, and volumes. After you collect this data, you can analyze it to determine which MDisk are used frequently. The procedure then takes you through querying and migrating extents to different locations in the same parent pool. This procedure can only be completed using the command-line interface.

If performance monitoring tools indicate that an MDisk in the pool is being overused, you can migrate data to other MDisk within the same parent pool.

Procedure

1. Determine the number of extents that are in use by each volume for the MDisk by issuing this CLI command:

```
lsmdiskextent mdiskname
```

This command returns the number of extents that each volume is using on the MDisk. Select some of these extents to migrate within the pool.

2. Determine the other MDisk that are in the same volume.

a) To determine the parent pool that the MDisk belongs to, issue this CLI command:

```
lsmdisk mdiskname / ID
```

b) List the MDisk in the pool by issuing this CLI command:

```
lsmdisk -filtervalue mdisk_grp_name=mdiskgrpname
```

3. Select one of these MDisk as the target MDisk for the extents. You can determine how many free extents exist on an MDisk by issuing this CLI command:

```
lsfreeextents mdiskname
```

You can issue the **lsmdiskextent newmdiskname** command for each of the target MDisk to ensure that you are not just moving the over-utilization to another MDisk. Check that the volume that owns the set of extents to be moved does not already own a large set of extents on the target MDisk.

4. For each set of extents, issue this CLI command to move them to another MDisk:

```
migrateexts -source mdiskname / ID -exts num_extents  
-target newmdiskname / ID -threads 4 -vdisk vdiskid
```

where *num_extents* is the number of extents on the *vdiskid*. The *newmdiskname / ID* value is the name or ID of the MDisk to migrate this set of extents to.

Note: The number of threads indicates the priority of the migration processing, where **1** is the lowest priority and **4** is the highest priority.

5. Repeat the previous steps for each set of extents that you are moving.
6. You can check the progress of the migration by issuing this CLI command:

```
lsmigrate
```

Migrating volumes between pools using the CLI

You can migrate volumes between pools using the command-line interface (CLI).

About this task

You can determine the usage of particular MDisk by gathering input/output (I/O) statistics about nodes, MDisk, and volumes. After you collect this data, you can analyze it to determine which volumes or MDisk are hot. You can then migrate volumes from one storage pool to another.

Complete the following step to gather statistics about MDisk and volumes:

1. Use secure copy (**scp** command) to retrieve the dump files for analyzing. For example, issue the following command:

```
scp clusterip:/dumps/iostats/v_*
```

This command copies all the volume statistics files to the AIX host in the current directory.

2. Analyze the memory dumps to determine which volumes are hot. It might be helpful to also determine which MDisk are being used heavily as you can spread the data that they contain more evenly across all the MDisk in the storage pool by migrating the extents.

After you analyze the I/O statistics data, you can determine which volumes are hot. You also need to determine the storage pool that you want to move this volume to. Either create a new storage pool or determine an existing group that is not yet overly used. Check the I/O statistics files that you generated and then ensure that the MDisk or volumes in the target storage pool are used less than the MDisk or volumes in the source storage pool.

You can use data migration or volume mirroring to migrate data between storage pools. Data migration uses the command **migratevdisk**. Volume mirroring uses the commands **addvdiskcopy** and **rmvdiskcopy**.

Migrating data using migratevdisk

You can use the **migratevdisk** command to migrate data between two storage pools. When you issue the **migratevdisk** command, a check is made to ensure that the destination of the migration has enough free extents to satisfy the command. If it does, the command proceeds. The command takes some time to complete.

Notes:

- You cannot use the data migration function to move a volume between storage pools that have different extent sizes.
- Migration commands fail if the target or source volume is offline, there is no quorum disk defined, or the defined quorum disks are unavailable. Correct the offline or quorum disk condition and reissue the command.
- The system supports migrating volumes between child pools within the same parent pool or migrating a volume in a child pool to its parent pool. Migration of volumes fails if source and target child pools have different parent pools. However, you can use **addvdiskcopy** and **rmvdiskcopy** commands to migrate volumes between child pools in different parent pools.

When you use data migration, it is possible for the free destination extents to be consumed by another process; for example, if a new volume is created in the destination parent pool or if more migration commands are started. In this scenario, after all the destination extents are allocated, the migration commands suspend and an error is logged (error ID 020005). To recover from this situation, use either of the following methods:

- Add more MDisks to the target parent pool, which provides more extents in the group and allows the migrations to be restarted. You must mark the error as fixed before you reattempt the migration.
- Migrate one or more volumes that are already created from the parent pool to another group. This action frees up extents in the group and allows the original migrations to be restarted.

Complete the following steps to use the **migratevdisk** command to migrate volumes between storage pools:

1. After you determine the volume that you want to migrate and the new storage pool that you want to migrate it to, issue the following CLI command:

```
migratevdisk -vdisk vdisk_name
```

```
-mdiskgrp  
mdisk_group_name -threads 4
```

2. You can check the progress of the migration by issuing the following CLI command:

```
lsmigrate
```

Migrating data using volume mirroring

When you use data migration, the volume goes offline if either pool fails. Volume mirroring can be used to minimize the impact to the volume because the volume goes offline only if the source pool fails. You can migrate volumes between child pools or from a child pool to a parent pool using the **addvdiskcopy** and **rmvdiskcopy** commands instead of using the **migratevdisk** command. Complete the following steps to use volume mirroring to migrate volumes between pools:

1. After you determine the volume that you want to migrate and the new pool that you want to migrate it to, enter the following command:

```
addvdiskcopy -mdiskgrp mdisk_group_name -autodelete vdisk_name
```

where *mdisk_group_name* is the name of the new storage pool and *vdisk_name* is the name of the volume that is being copied. Specify **-autodelete** to automatically delete the original copy of the volume after the copies are synchronized.

2. The copy ID of the new copy is returned. The copies now synchronize such that the data is stored in both storage pools. You can check the progress of the synchronization by issuing the following command:

```
lsvdisksyncprogress
```

Moving a volume between I/O groups using the CLI

To move volumes between I/O groups non-disruptively, ensure that hosts are mapped to the volume, support non-disruptive volume move. The cached data that is held within the system must first be written to the system disk before the allocation of the volume can be changed.

About this task

Modifying the I/O group that services the volume can be done concurrently with I/O operations if the host supports non-disruptive volume move. It also requires a rescan at the host level to ensure that the multipathing driver is notified that the allocation of the preferred node has changed and the ports by which the volume is accessed has changed. This can be done in the situation where one pair of nodes becomes over used.

If there are any host mappings for the volume, the hosts must be members of the target I/O group or the migration fails.

Verify that you created paths to I/O groups on the host system. After the system successfully adds the new I/O group to the volume's access set and you moved selected volumes to another I/O group, detect the new paths to the volumes on the host. The commands and actions on the host vary depending on the type of host and the connection method used. These steps must be completed on all hosts to which the selected volumes are currently mapped.

You can also use the management GUI to move volumes between I/O groups non-disruptively. In the management GUI, select **Volumes > Volumes**. On the Volumes panel, select the volume that you want to move and select **Actions > Move to Another I/O Group**. The wizard guides you through all the steps that are necessary for moving a volume to another I/O group, including any changes to hosts that are required. Click **Need Help** on the associated management GUI panels for details.

Note: If the selected volume is performing quick initialization, this wizard is unavailable until quick initialization is complete.

To move a volume between I/O groups using the CLI, complete the following steps:

Procedure

1. Issue the following command: **addvdiskaccess -iogrp iogrp id/name volume id/name**
2. Issue the following command: **movevdisk -iogrp destination iogrp -node new preferred node volume id/name**
The system disables moving a volume if the selected volume is currently performing quick initialization. After the quick initialization completes, you can move the volume to another I/O group.
3. Issue the appropriate commands on the hosts that are mapped to the volume to detect the new paths to the volume in the destination I/O group.
4. After confirming that the new paths are online, remove access from the old I/O group:
rmvdiskaccess -iogrp iogrp id/name volume id/name
5. Issue the appropriate commands on the hosts that are mapped to the volume to remove the paths to the old I/O group.

Creating an image-mode volume using the CLI

You can use the command-line interface (CLI) to import storage that contains existing data and continue to use this storage. You can also use the advanced functions, such as Copy Services, data migration, and the cache. These disks are known as image-mode volumes.

About this task

Make sure you are aware of the following information before you create image-mode volumes:

1. Unmanaged-mode managed disks (MDisks) that contain existing data cannot be differentiated from unmanaged-mode MDisks that are blank. Therefore, it is vital that you control the introduction of these MDisks to the clustered system by adding these disks one at a time. For example, map a single LUN from your RAID storage system to the clustered system and refresh the view of MDisks. The newly detected MDisk is displayed.
2. Do not manually add an unmanaged-mode MDisk that contains existing data to a parent pool. If you do, the data is lost. When you use the command to create an image-mode volume from an unmanaged-mode disk, select the parent pool where it should be added. Ensure that the pool that is selected is not a child pool. Child pools are created from existing pools, called parent pools, and get capacity from the parent pool, not MDisks.

Complete the following steps to create an image-mode volume:

Procedure

1. Stop all I/O operations from the hosts. Unmap the logical disks that contain the data from the hosts.
2. Create one or more storage pools.
Ensure that the pool is not a child pool.
3. Map a single array or logical unit from your RAID storage system to the clustered system. You can do this through a switch zoning or a RAID storage system based on your host mappings.
The array or logical unit appears as an unmanaged-mode MDisk to the system.
4. Issue the **lsmdisk** command to list the unmanaged-mode MDisks.

If the new unmanaged-mode MDisk is not listed, you can complete a fabric-level discovery. Issue the **detectmdisk** command to scan the Fibre Channel network for the unmanaged-mode MDisks.

Note: The **detectmdisk** command also rebalances MDisk access across the available storage system device ports.
5. Convert the unmanaged-mode MDisk to an image-mode volume.

Note: If the volume that you are converting maps to a flash drive, the data that is stored on the volume is not protected against Flash drive failures or node failures. To avoid data loss, add a volume copy that maps to an Flash drive on another node.

Issue the **mkvdisk** command to create an image-mode volume object.
6. Map the new volume to the hosts that were previously using the data that the MDisk now contains.
You can use the **mkvdiskhostmap** command to create a new mapping between a volume and a host. This makes the image-mode volume accessible for I/O operations to the host.

Results

After the volume is mapped to a host object, the volume is detected as a disk drive with which the host can complete I/O operations.

What to do next

If you want to virtualize the storage on an image-mode volume, you can transform it into a striped volume. Migrate the data on the image-mode volume to managed-mode disks in another storage pool. Issue the **migratevdisk** command to migrate an entire image-mode volume from one storage pool to

another storage pool. Ensure that the storage pool that you migrate the image-mode volume to is not a child pool.

Migrating data to an image mode volume using the CLI

You can use the command-line interface (CLI) to migrate data to an image mode volume.

About this task

Use the **migratetoimage** CLI command to migrate the data from an existing volume onto a different managed disk (MDisk).

When the **migratetoimage** CLI command is issued, it migrates the data of the user specified source volume onto the specified target MDisk. When the command completes, the volume is classified as an image mode volume.

Note: Migration commands fail for the following reasons:

- The target or source volume is offline.
- A quorum disk is not defined.
- Defined quorum disks are unavailable.

Correct the offline or quorum disk condition and reissue the command.

The MDisk specified as the target must be in an unmanaged state at the time the command is run. Using this command results in the inclusion of the MDisk into the user specified storage pool.

Enter the following CLI command to migrate data to an image mode volume:

```
migratetoimage -vdisk source_vdisk_name -mdisk unmanaged_target_mdisk_name -  
mdiskgrp managed_disk_group_name
```

where *source_vdisk_name* is the name of the image mode volume, *unmanaged_target_mdisk_name* is the name of the new MDisk, and *managed_disk_group_name* is the name of the new storage pool. For example, the following command migrates data from the vdisk0 image mode volume to the mdisk5 target in the mdgrp2 storage pool:

```
migratetoimage -vdisk vdisk0 -mdisk mdisk5 -mdiskgrp mdgrp2
```

Deleting a node from a system by using the CLI

You can use the command line interface (CLI) to remove a node from a system.

Before you begin

After the node is deleted, the other node in the I/O group enters write-through mode until another node is added back into the I/O group.

By default, the **rmnode** command flushes the cache on the specified node before the node is taken offline. When the system is operating in a degraded state, the system ensures that data loss does not occur as a result of deleting the only node with the cache data.

Attention:

- If you are removing a single node and the remaining node in the I/O group is online, the data can be exposed to a single point of failure if the remaining node fails.
- If both nodes in the I/O group are online and the volumes are already degraded before you delete the node, redundancy to the volumes is already degraded. If the **force** option is used, removing a node might result in loss of access to data, and data loss might occur.
- Removing the last node destroys the system. Before you delete the last node in the system, ensure that you want to destroy the system.
- When you delete a node, you remove all redundancy from the I/O group. As a result, new or existing failures can cause I/O errors on the hosts. The following failures can occur:

- Host configuration errors
- Zoning errors
- Multipathing software configuration errors
- If you are deleting the last node in an I/O group and volumes are assigned to the I/O group, you cannot delete the node from the system if the node is online. You must back up or migrate all data that you want to save before you delete the node. If the node is offline, you can delete the node.
- To take the specified node offline immediately without flushing the cache or ensuring that data loss does not occur, run the **rmnode** command with the **force** parameter. The **force** parameter forces continuation of the command even though any node-dependent volumes will be taken offline. Use the **force** parameter with caution; access to data on node-dependent volumes will be lost.
- To delete a node that is in the service state and that has an associated spare node, you must specify the **-deactivatespare** parameter with the **rmnode** command.

About this task

Complete these steps to delete a node:

Procedure

1. If you are deleting the last node in an I/O group, determine the volumes that are still assigned to this I/O group:

- a) Issue the following CLI command to request a filtered view of the volumes:

```
lsvdisk -filtervalue IO_group_name=name
```

Where *name* is the name of the I/O group.

- b) Issue the following CLI command to list the hosts that this volume is mapped to:

```
lsdiskhostmap vdiskname/identification
```

Where *vdiskname/identification* is the name or identification of the volume.

Note: If volumes are assigned to this I/O group that contain data that you want to continue to access, back up the data or migrate the volumes to a different (online) I/O group.

2. Issue this CLI command to delete a node from the clustered system:

Attention: Before you delete the node, note the following information. The **rmnode** command checks for node-dependent volumes, which are not mirrored at the time that the command is run. If any node-dependent volumes are found, the command stops and returns a message. To continue removing the node despite the potential loss of data, run the **rmnode** command with the **force** parameter. Alternatively, follow these steps before you remove the node to ensure that all volumes are mirrored:

- a. Run the **lsdependentvdisks** command.
- b. For each node-dependent volume that is returned, run the **lsvdisk** command.
- c. Ensure that each volume returns in-sync status.

```
rmnode node_name_or_identification
```

Where *node_name_or_identification* is the name or identification of the node.

Note: Before a node is removed, the command checks for any node-dependent volumes that would go offline. If the node that you selected to delete contains a flash drive that has dependent volumes, volumes that use the flash drives go offline and become unavailable if the node is deleted. To maintain access to volume data, mirror these volumes before you remove the node. To continue removing the node without mirroring the volumes, specify the **force** parameter.

Completing the system maintenance procedure by using the CLI

You can use the command line interface (CLI) to complete the system maintenance procedure.

About this task

Use a Secure Shell (ssh) client to log in to the configuration node of the system and complete the following steps to finish the system maintenance procedure.

Procedure

1. Enter the **lseventlog -order severity -message no** CLI command to produce the current list of unfixed errors detected by the system in order of severity. The list begins with the highest severity errors.
2. Refer to the Error codes reference topic to find the error code description. Follow the service actions to locate and fix the cause of the error.
3. Enter the following command to mark the error as fixed:
`cheventlog -fix sequence_number`
Where *sequence_number* is the number for the fixed error in the event log.
4. Repeat [step 1](#) through [step 3](#) until all the unfixed errors are resolved.

Note: A new event is created in the event log if the system continues to detect the error after it is marked as fixed. The new event has a new sequence number, time stamp, and other details.

Modifying system IP addresses using the CLI

Use the command-line interface (CLI) to change the IP addresses that are associated with a system.

About this task

Attention: When you specify a new IP address for a system, the existing communication with the system is broken. You must reconnect to the system with the new IP address. Additionally, the address for a system IP address cannot be the same address that is used for the service IP address. Using the same IP address causes an error.

Procedure

To change the system IP address, complete the following steps:

1. Issue the **lssystemip** command to list IP addresses that are used by the system.
2. Record the IP addresses for future reference.
3. To change an Internet Protocol Version 4 (IPv4) system IP address, issue this command:

```
chsystemip -clusterip cluster_ip_address -port cluster_port
```

where *cluster_ip_address* is the new IP address for the system and *cluster_port* specifies the port (1 or 2) where changes apply.

4. To change an IPv4 system IP address to an IPv6 system IP address, issue this command:

```
chsystemip -clusterip_6 cluster_ip_address -port cluster_port
```

where *cluster_ip_address* is the new Internet Protocol Version 6 (IPv6) address for the system and *cluster_port* specifies the port (1 or 2) where changes apply.

5. To change an IPv4 default gateway IP address, issue this command:

```
chsystemip -gw cluster_gateway_address -port cluster_port
```

where *cluster_gateway_address* is the new gateway address for the system and *cluster_port* specifies the port (1 or 2) where changes apply.

6. To change an IPv6 default gateway address, issue this command:

```
chsystemip -gw_6 cluster_gateway_address -port cluster_port
```

where *cluster_gateway_address* is the new gateway address for the system and *cluster_port* specifies the port (1 or 2) where changes apply.

7. Issue this command to change an IPv4 system subnet mask

```
chsystemip -mask cluster_subnet_mask -port cluster_port
```

where *cluster_subnet_mask* is the new subnet mask for the system and *cluster_port* specifies the port (1 or 2) where changes apply.

8. For IPv6 addresses, you can issue this command to set the prefix for the system:

```
chsystemip -prefix_6 -port cluster_port
```

where *cluster_port* specifies the port (1 or 2) where changes apply.

9. Optionally, to delete all of the IPv4 addresses in the system after you change all addresses to IPv6, issue this command:

```
chsystem -noip
```

10. Optionally, to delete all of the IPv6 addresses in the system after you change all addresses to IPv4, issue this command:

```
chsystem -noip_6
```

11. Display the IP routing table (optional) by using the CLI command `lsroute` as follows:

```
lsroute
```

The IP routing table provides details of the gateway that is used for IP traffic to a range of IP addresses for each Ethernet port. This information can be used to diagnose configuration node accessibility problems.

12. Issue the **ping** command (optional) to diagnose IP configuration problems. An example of the command is as follows:

```
ping -srcip4 source_ipv4_address destination_ipv4_address -srcip6 source_ipv6_address destination_ipv6_address
```

Changing the system gateway address by using the CLI

You can use the command-line interface (CLI) to change the gateway address for a system.

Procedure

To change the system gateway address, complete the following steps:

1. Issue the **lssystemip** command to list the current gateway address of the system.
2. Record the current gateway address for future reference.
3. Issue the following command to change an IPv4 system gateway address:

```
chsystemip -gw cluster_gateway_address -port cluster_port
```

where *cluster_gateway_address* is the new gateway address for the system. The **port** parameter specifies which port (1 or 2) to apply changes to.

4. Issue the following command to change an IPv6 system gateway address:

```
chsystemip -gw_6 cluster_gateway_address -port cluster_port
```

where *cluster_gateway_address* is the new gateway address for the system. The **port** parameter specifies which port (1 or 2) to apply changes to.

Changing the relationship bandwidth for a system by using the CLI

You can use the command-line interface (CLI) to change the relationship bandwidth for a system.

About this task

The relationship bandwidth limit controls the maximum rate at which any one remote-copy relationship can synchronize. The overall limit is controlled by the **bandwidth** parameter of each system partnership. The default value for the relationship bandwidth limit is 25 megabytes per second (MBps), but you can change this value by following these steps:

Procedure

1. Issue the **lssystem** command to list the current relationship bandwidth limit of the system.

For example:

```
lssystem system_id_or_system_name
```

Where *system_id_or_system_name* is the ID or name of the system.

2. For future reference, record the current relationship bandwidth limit that is displayed.

For example: `relationship_bandwidth_limit 25`

3. To change the relationship bandwidth limit of the system, issue the following command:

```
chsystem -relationshipbandwidthlimit  
system_relationship_bandwidth_limit
```

Where *system_relationship_bandwidth_limit* is the new limit for the system. If the system is in a remote partnership with another system, then the bandwidth setting must be the same between both systems in the partnership. Issue the command on both systems in the partnership. Issue the command on both systems in a relationship.

Configuring the system for iSCSI or iSER hosts

You need to complete several tasks to configure the system to work with iSCSI or iSER-attached hosts. The tasks include general tasks on the host system before you configure a system.

Before you begin

Before you complete any configuration tasks on the system, it is important that you complete all the iSCSI-related configuration on the host system. Some systems also support iSER connections. If you want to use an iSER-attached host, verify support and any installation requirements before using this function. Because the system supports various host machines, consult the documentation for specific instructions and requirements for a particular host. For a list of supported hosts, see this website:

www.ibm.com/support

About this task

To configure a system for iSCSI or iSER, follow these general tasks on the host system:

1. Select a software-based iSCSI initiator and verify the iSCSI or iSER driver installation.
2. If required, install and configure a multipathing driver for the host system.

In addition, determine a naming convention for iSCSI or iSER names, such as qualified names (IQNs) for your system. Hosts use iSCSI or iSER names to connect to the node. Each node, for example, has a unique IQN, and the system name and node name are used as part of that IQN.

Port IP addresses are the IP addresses that are used by iSCSI or iSER-attached hosts to process I/O. Host port group IDs are automatically assigned to the port. Host port grouping groups the ports that have the same maximum port speed and ensures that no more than four ports are discovered by a host.

Procedure

1. To configure a new port IP address to a specified Ethernet port of a node with an IPv4 address, enter the following command-line interface (CLI) command:

```
cfgportip -node node_name -ip ipv4addr  
-gw ipv4gw -mask subnet_mask -failover -vlan vlan_id port_id
```

Where *node_name* / *node_id* specifies the name or ID of the node that is being configured, *ipv4addr* is the IPv4 address for the Ethernet port, *ipv4gw* is the IPv4 gateway IP address, *subnet_mask* is the IPv4 subnet mask, and *port_id* specifies the Ethernet port ID (1 or 2). To view a list of ports, use the **lsportip** command.

The optional **-failover** parameter specifies that the IP is a failover IP and is related to the partner node. If the node that is specified is the only online node in the I/O group, the address is configured and presented by this node. When another node in the I/O group comes online, the failover address is presented by that node. If two nodes in the I/O group are online when the command is entered, the address is presented by the other node to the partner node.

The optional **-vlan** parameter sets the virtual local area network (VLAN) ID for an IPv4 address that is configured for iSCSI or iSER host attachment.

For more information about the **-vlan** parameter, see the information about configuring VLAN for iSCSI or iSER by using the CLI.

2. To configure a new port IP address to a specified Ethernet port of a node with an IPv6 address, enter the following CLI command:

```
cfgportip -node node_name | node_id -ip_6 ipv6addr  
-gw_6 ipv6gw -prefix_6 prefix -failover -vlan_6 vlan_id port_id
```

Where *node_name* / *node_id* specifies the name or ID of the node that is being configured, *ipv6addr* is the IPv6 address for the Ethernet port, *ipv6gw* is the IPv6 gateway IP address, *subnet_mask* is the IPv6 subnet mask, and *port_id* specifies the Ethernet port ID (1 or 2). To view a list of ports, use the **lsportip** command.

The optional **-failover** parameter specifies that the IP is a failover IP that is related to the partner node. If the node that is specified is the only online node in the I/O group, the address is configured and presented by this node. When another node in the I/O group comes online, the failover address is presented by that node. If two nodes in the I/O group are online when the command is entered, the address is presented by the other node to the node that is specified.

The optional **-vlan_6** parameter sets the virtual local area network (VLAN) ID for an IPv6 address that is configured for iSCSI or iSER host attachment.

For more information about the **-vlan** parameter, see the information about configuring VLAN for iSCSI or iSER by using the CLI.

3. After IP configuration, *host_port_group_ids* are automatically assigned to all the host attached enabled ports and consist of the following criteria:

- A *host_port_group_id* is an automatic grouping of ports that is designated by an integer. Host port group IDs are unique across I/O groups.
- Each host port group ID contains a maximum of four ports.
- All ports within a host port group ID have identical speeds.
- Identical host port group IDs are assigned to the failover port. If a *host_port_group_id* is already assigned to a failover port, the same *host_port_group_id* is assigned to a local port.
- Enabling -host flag to *yes* assigns the *host_port_group_id*. On a port with host flag *no* and the host flag is set to *yes*, this results in assignment of a *host_port_group_id* to a port.

4. To remove an IP address from a node Ethernet port, enter either of these CLI commands.

The following command deletes an IPv4 configuration for the specified Ethernet port:

```
rmportip -failover  
-node node_name | node_id port_id
```

where *node_name* / *node_id* specifies the name or ID of the node with the Ethernet port that the IP address is being removed from and *port_id* specifies the Ethernet port ID. To list the valid values for the Ethernet port, enter the **lsportip** command. The optional **-failover** parameter indicates that the specified data is failover data.

The following command deletes an IPv6 configuration for the specified Ethernet port:

```
rmportip -ip_6 -failover  
-node node_name | node_id port_id
```

Where **-ip_6** indicates that this command removes an IPv6 configuration, *node_name* / *node_id* specifies the name or ID of the node with the Ethernet port that the IP address is being removed from, and *port_id* specifies the Ethernet port ID. To list the valid values for the Ethernet port, enter the **lsportip** command. The optional **-failover** parameter indicates that the specified data is failover data.

5. To display the host port group ID in addition to other parameters for each Ethernet port, enter the **lsportip** command. Entering this command displays a detailed view of the specified port:

```
lsportip Ethernet_port_id
```

where *Ethernet_port_id* is the specified port. The parameter **host_port_grp_id** displays the value of the host port group ID.

6. After all the IP addresses of the ports are removed, the host port group ID that is associated with a port is removed. The host port group ID is also removed when the **-host** flag is set to *no* from *yes* on the port.

What to do next

After you configure your IP addresses, you can optionally create or configure several iSCSI or iSER items.

Configuring or modifying an iSCSI alias by using the CLI

You can use the command-line interface (CLI) to optionally create or change the iSCSI alias for the selected node. An iSCSI alias is a user-assigned name that identifies a node to the iSCSI or iSER-attached host.

About this task

To configure or modify an iSCSI alias, follow these steps:

Procedure

1. To configure a new port IP address to a specified Ethernet port of a node, enter the following CLI command:

```
chnode -iscsialias alias node_name | node_id
```

where *alias* *node_name* / *node_id* specifies the name or ID of the node.

2. To specify that the name or iSCSI alias that is being set is the name or alias of the partner node in the I/O group, enter the following CLI command.

When a system does not have a partner node, the values set are applied to the partner node when it is added to the system. If this parameter is used when there is a partner node, the name or alias of that node changes.

```
chnode -iscsialias alias -failover node_name | node_id
```

Where *alias* specifies the iSCSI name of the node and *node_name* / *node_id* specifies the node to be modified.

What to do next

After you create iSCSI aliases, you can optionally configure the address for the internet Storage Name Service (iSNS) server for the system.

Configuring the iSNS server address by using the CLI

If you are using iSCSI or iSER-attached hosts with a clustered system, you can use the command-line interface (CLI) to optionally configure the address for the internet Storage Name Service (iSNS) server for the system. Host systems use the iSNS server to manage iSCSI or iSER targets and for iSCSI or iSER discovery.

Procedure

1. To specify an IPv4 address for the iSCSI storage name service (SNS), enter the following CLI command:

```
chsystem -isnsip sns_server_address
```

Where *sns_server_address* is the IP address of the iSCSI storage name service in IPv4 format.

2. To specify an IPv6 address for the iSCSI storage name service (SNS), enter the following CLI command:

```
chsystem -isnsip_6 ipv6_sns_server_address
```

Where *ipv6_sns_server_address* is the IP address of the iSCSI storage name service in IPv6 format.

Configuring system iSCSI or iSER authentication by using the CLI

You can use the command-line interface (CLI) to configure the system to authenticate with iSCSI or iSER-attached hosts by using the Challenge-Handshake Authentication Protocol (CHAP). After the CHAP is set for the system, all attached hosts must be configured to authenticate. When you are troubleshooting a problem, you can delay your configuration of the CHAP authentication until after you configure the first one or two hosts and test their connectivity.

About this task

To configure authentication between the system and the iSCSI or iSER-attached hosts, follow these steps:

Procedure

1. To configure CHAP authentication for an iSCSI or iSER host, enter the following CLI command:

```
chhost -iscsiusername iscsi_username -chapsecret chap_secret host_name
```

Where *iscsi_username* is the user name, *chap_secret* is the CHAP secret to be used to authenticate the system via iSCSI or iSER, and *host_name* is the name of the iSCSI or iSER host. The *chap_secret* value must be 12 characters. If you do not specify the iSCSI user name, the initiator's IQN is taken as the user name for one-way CHAP authentication.

2. To set the authentication method for the iSCSI or iSER communications of the system, enter the following CLI command:

```
chsystem -iscsiauthmethod chap -chapsecret chap_secret
```

Where *chap* specifies that CHAP is the authentication method and *chap_secret* is the CHAP secret to be used. The specified CHAP secret cannot begin or end with a space.

3. To clear all CHAP secrets for iSCSI or iSER authentication that were previously set, enter the following CLI command:

```
chsystem -nochapsecret
```

If the **chapsecret** parameter is specified, the **nochapsecret** parameter is not allowed.

4. Run the **lsiscsiauth** command to display the Challenge Handshake Authentication Protocol (CHAP) secret that you configured.

What to do next

After you configure the CHAP secret for the system, ensure that the system CHAP secret is added to each iSCSI or iSER-attached host. On all iSCSI or iSER-attached hosts, specify a CHAP secret that the hosts use to authenticate to the system.

Configuring remote authentication service using the CLI

Remote authentication allows users to authenticate to the system using credentials stored on an external authentication service.

About this task

When you configure remote authentication, you do not need to configure users on the system or assign additional passwords. You can use your existing passwords and user groups that are defined on the remote service to simplify user management and access, to enforce password policies more efficiently, and to separate user management from storage management.

If a user is configured on the system as a local user, only local credentials are used. Otherwise, users who are entering their password are authenticated against the remote service when they use the management GUI or the command-line interface (CLI). Their roles are determined according to group memberships defined on the remote service. If a user is configured on the system as a remote user with an SSH key, the user can additionally access the command-line interface by using this Secure Shell (SSH) key. Group memberships continue to be determined from the remote service.

Configuring remote authentication service with Lightweight Directory Access Protocol (LDAP) by using the CLI

You can use the command-line interface (CLI) to configure the system to authenticate users against servers that implement the Lightweight Directory Access Protocol (LDAP), including Active Directory (AD).

About this task

- Users on provisioned LDAP servers with IBMRBS permissions of Supervisor Access or Supervisor Role can log in to the system as Administrator, but cannot run the [satask](#) command.
- All authentication commands and settings are disabled.
 - Automatically provisioned settings are not visible to the user and are not displayed by the [lssystem](#) or [lsldapserver](#) commands.
 - The [chauthservice -refresh](#) command is enabled.

All options on the system GUI LDAP page are disabled.

Tip: A superuser cannot be authenticated if the superuser is using a remote Lightweight Directory Access Protocol (LDAP server). However, other users can authenticate in this manner.

Procedure

To enable user authentication with LDAP, follow these steps:

1. Configure LDAP by entering the **chldap** command.

This command provides default settings for both Tivoli® Directory Server and AD. To configure authentication with Tivoli Directory Server schema defaults and Transport Layer Security (TLS), for example, enter the following command:

```
chldap -type itds -security tls
```

LDAP configuration can be inspected with the **lsldap** command.

Note: Use TLS so that transmitted passwords are encrypted.

2. Specify the **mkldapserver** command to define up to six LDAP servers to use for authentication.

Multiple servers can be configured to provide access to different sets of users or for redundancy. All servers must share the settings that are configured with **chldap**. To configure an LDAP server with a Secure Socket Layer (SSL) certificate and users in the `cn=users,dc=company,dc=com` subtree, for example, enter the following command:

```
mkldapserver -ip 9.71.45.108 -basedn cn=users,dc=company,dc=com -sslcert /tmp/sslcert.pem
```

You can also configure which servers are preferred to authenticate users.

Specify **lsldapserver** for LDAP server configuration information. Specify **chldapserver** and **rmldapserver** to change the configured LDAP servers.

3. Configure user groups on the system by matching those user groups that are used by the authentication service.

For each group of interest that is known to the authentication service, a system user group must be created with the same name and with the remote setting enabled. If members of a group that is called `sysadmins`, for example, require the system administrator (admin) role, enter the following command:

```
mkusergrp -name sysadmins -remote -role Administrator
```

If none of the user groups match a system user group, the user cannot access the system.

4. Verify your LDAP configuration by using the **testldapserver** command.

To test the connection to the LDAP servers, enter the command without any options. A user name can be supplied with or without a password to test for configuration errors. To process a full authentication attempt against each server, enter the following commands:

```
testldapserver -username username -password 'password'
```

5. Enter the following command to enable LDAP authentication:

```
chauthservice -type ldap -enable yes
```

6. Configure users who do not require Secure Shell (SSH) key access.

Delete system users who must use the remote authentication service and do not require SSH key access.

Remember: A superuser cannot be deleted or use the remote authentication service.

7. Configure users who require SSH key access.

All system users who use the remote authentication service and require SSH key access must have remote settings that are enabled and a valid SSH key that is configured on the system.

Changing user groups

You can use the command-line interface (CLI) to change user groups. User groups organize users of a clustered system by role.

About this task

Roles apply to both local and remote users on the system and are based on the user group to which the user belongs. A local user can belong only to a single group; therefore, the role of a local user is defined by the single group that the user belongs to. Remote users can belong to one or more groups; therefore, the roles of remote users are assigned according to the groups that the remote user belongs to.

To change a user group in the management GUI, select **Access > Users**. Select a user group and select **Properties** from the **Actions** menu.

To change a user group using the CLI, use the **chusergrp** CLI command.

Procedure

1. Use the **chusergrp** CLI command to change the attributes of an existing user group.
For example, enter the following command:

```
chusergrp -role role_name -remote yes | no group_id_or_name
```

where *role_name* specifies the role that is associated with any users that belong to this group and *group_id_or_name* specifies the group to be changed. The **remote** parameter specifies whether the group is visible to the authentication server.

2. Issue the **lsusergrp** CLI command to display the user groups that were created on the system.
For example, enter the following command:

```
lsusergrp usergrp_id_or_name
```

where *group_id_or_name* specifies the user group to view. If you do not specify a user group ID or name, all user groups on the system are displayed.

Changing users

You can use the command-line interface (CLI) or the management GUI to change users on the system.

Before you begin

System users must provide either a password, a Secure Shell (SSH) key, or both. Local users are authenticated through the authentication methods that are on the system.

You can create two categories of users that access the system. These user types are based on how they authenticate to the system:

- Some users must provide an SSH password (or if not possible an SSH key).
- If a user needs access to the management GUI, a password is needed for the user.
- If the user requires access to the command-line interface (CLI), a valid password and SSH key can be used.
- Users must be in a user group that is defined on the system.

Remote users can also configure local credentials if they need to access the system when the remote service is down. Remote users have their groups that are defined by the remote authentication service.

To change a user in the management GUI, select **Access > Users**. Right-click the user and select **Modify** from the **Actions** menu. For local users, you can change the user name, password, and the SSH Public key file. For remote users, you can change the user name and the SSH Public key file. The password is maintained and authenticated through the remote authentication service.

About this task

To change a user in the CLI, follow these steps:

Procedure

1. Use the **chuser** CLI command to change the attributes of an existing user.
For example, enter the following command:

```
chuser -usergrp group_id_or_name user_id_or_name
```

where the *group_id_or_name* specifies the new group for the user and *user_id_or_name* specifies the user to be changed.

2. Use the **chcurrentuser** CLI command to change the attributes of the current user.
For example, enter the following command:

```
chcurrentuser -nokey
```

where the **nokey** parameter specifies that the SSH key of the user is to be deleted.

3. Use the **lscurrentuser** CLI command to display the name and role of the logged-in user.
For example, enter the following command:

```
lscurrentuser
```

The name and the role of the user are displayed.

Managing SNMP notifications

Simple Network Management Protocol (SNMP) is a standard protocol for managing networks and exchanging messages. The system can send SNMP messages that notify personnel about an event. You can use an SNMP manager to view the SNMP messages that the system sends. [The system supports both SNMP version 2 and version 3.](#)

About this task

Some systems support setting up SNMP notifications for events. Event notifications are reported to the SNMP destinations of your choice. To specify an SNMP destination, you *must* provide a valid IP address. A maximum of six SNMP destinations can be specified. For version 2 SNMP servers, the community string is required and the default value is `public`. You can use the Management Information Base (MIB) file for SNMP to configure a network management program to receive SNMP messages that are sent by the system. This file can be used with SNMP messages from all versions of the software. You can use your browser to download the MIB file by clicking **Download MIB**. [The system supports both SNMP version 2 and version 3. SNMP version 3 uses the same base protocol as earlier versions, but introduces encryption and improved authentication mechanisms. Depending on how you authorize with the SNMP agent on a system, you can configure different levels of security.](#)

[These different security levels depend on the credentials that you configure to authenticate successfully to the SNMP server.](#)

<i>Table 12. Security levels and required credentials for SNMP version 3 servers</i>		
Security Level	Description	Required security credentials
None	No additional authentication or encryption is used to send SNMP notifications.	<ul style="list-style-type: none">• Engine ID• Security Name

Table 12. Security levels and required credentials for SNMP version 3 servers (continued)

Security Level	Description	Required security credentials
Authentication	Notifications are authenticated, but message content is not encrypted.	<ul style="list-style-type: none"> Engine ID Security Name Authentication Protocol Authentication Passphrase
Authentication and Privacy	Notifications are authenticated and message content is encrypted.	<ul style="list-style-type: none"> Engine ID Security Name Authentication Protocol Authentication Passphrase Privacy Protocol Privacy Passphrase

To configure or manage SNMP servers in the management GUI, select **Settings > Notifications > SNMP**. To configure a new server, select **Add SNMP Server** or right-click an existing instance and select **Modify**.

For SNMP Version 3, use a unique engine ID for every system. The system does not automatically generate the engine ID. You can use an existing engine ID from an SNMP server. If you are setting up SNMP for the first time, you must generate a new engine ID.

To configure the SNMP notification settings, use the following commands:

Procedure

1. To add an SNMP Version 3 server with full security (**AuthPriv**), enter the following command:

```
svctask mksnmpserver -ip 9.11.255.634 -engineid 0x80000002045370656356000000C021800002 -
securityname mysnmpcluster -authprotocol sha -authpassphrase cluster_auth_pw -privprotocol
aes -privpassphrase cluster_priv_pw
```

where **9.11.255.634** is the IP address for the server; **0x80000002045370656356000000C021800002** is the Engine ID; **mysnmpcluster** is the Security Name; **sha** is the Authentication Protocol; **cluster_auth_pw** is the Authentication Passphrase; **aes** is the Privacy Protocol; and **cluster_priv_pw** is the Privacy Passphrase for the SNMP v3 server.

2. To add an SNMP Version 3 server with minimum security (**NoAuthNoPriv**), enter the following command:

```
svctask mksnmpserver -ip 9.11.255.634 -engineid 0x80000002045370656356000000C021800002 -
securityname mynoauthnopriv
```

where **9.11.255.634** is the IP address for the server; **0x80000002045370656356000000C021800002** is the Engine ID; and **NoAuthNoPriv** is the Security Name for the SNMP v3 server.

3. To create an SNMP version 2 server to receive notifications, enter the following command:

```
mksnmpserver -ip 9.11.255.634
```

where **9.11.255.634** is the IP address for this server.

```
mksnmpserver -ip 9.11.255.634 -port remoteportnumber
```

where **9.11.255.634** is the IP address for this server and **remoteportnumber** is the port number for the remote SNMP server.

4. To change the settings of an existing SNMP server, enter the **chsnmpserver** command.

For example, enter the following command:

```
chsnmpserver -name server_name snmp_server_name_or_id
```

where *server_name* is the new name of the server and *snmp_server_name* is the name or ID of the server to be modified.

5. To remove an existing SNMP server from the system, enter the **rmsnmpserver** command.
For example, enter the following command:

```
rmsnmpserver snmp_server_name
```

where *snmp_server_name* is either the name of the SNMP server to be deleted.

6. To display either a concise list or a detailed view of the SNMP servers that are detected by the system, enter the **lssnmpserver** command.

For example, to display a concise view, enter the following command:

```
lssnmpserver -delim :
```

To display a detailed view of an SNMP server, enter the following command:

```
lssnmpserver snmp_server_name
```

Setting up syslog notifications

The syslog protocol is a standard protocol for forwarding log messages from a sender to a receiver on an IP network. The system can send syslog messages that notify personnel about an event. You can set up syslog event notifications with either the management GUI or the command-line interface (CLI).

About this task

The system can transmit syslog messages in either expanded or concise format. Servers configured with facility values of 0 - 3 receive syslog messages in concise format. Servers configured with facility values of 4 - 7 receive syslog messages in fully expanded format. The default value is 0. The facility number that is used in syslog messages also identifies the origin of the message to the receiving server. You can use a syslog manager to view the syslog messages that the system sends. For error, warning, and information notifications the format that messages are sent in depends on the facility setting. [Audit \(-audit\) and authentication \(-login\) messages are sent in a single format so for these messages there is no distinction between concise and expanded format.](#) The system supports both TCP and UDP transmission protocols to send the syslog message to the specified syslog servers. You can specify up to a maximum of six syslog servers with either an IP address or a domain name and its corresponding port. The default port for the TCP protocol is port 6514, and the default port for UDP transmissions is 514. If you are using a domain name to identify a syslog server, ensure that a DNS server is configured on the system. Domain names cannot exceed 40 characters.

The system supports the following syslog notifications and message types:

Error notifications

Select this option to send error notifications that can indicate a serious problem with the system.

Warning notifications

Select this option to send warning notifications that can indicate a problem or unexpected condition with the system. Always immediately investigate this type of notification to determine the effect that it might have on your operation, and make any necessary corrections.

Information notifications

Select this option to send information messages that indicate an expected operation has completed on the system.

Audit log messages

Select this option to include any CLI or management GUI operations on the specified syslog servers.

Authentication log messages

Select this option to send successful and failed authentication attempts to the specified syslog servers.

To configure or work with syslog notification settings in the management GUI, select **Settings > Notifications > Syslog**.

To configure and work with notification settings, use the following commands:

Procedure

1. Enter the **mksyslogserver** CLI command to specify the action that you want to take when a syslog error or event is logged to the error log.
For example, you can enter the following CLI command to set up a syslog notification:

```
mksyslogserver syslog_server_name -ip 9.11.255.123
```

where *syslog_server_name* is the name of the syslog server definition and *9.11.255.123* is the external Internet Protocol (IP) address of the syslog server.

2. To modify a syslog notification, enter the **chsyslogserver** command.
For example:

```
chsyslogserver syslog_server_name -ip 9.11.255.123
```

where *syslog_server_name* is the name of the syslog server definition and *9.11.255.123* is the external IP address of the syslog server.

3. To delete a syslog notifications and server definitions, enter the **rmsyslogserver** command.
For example:

```
rmsyslogserver syslog_server_name -force
```

4. To display either a concise list or a detailed view of syslog servers that are configured on the system, enter the **lssyslogserver** command.
For example, to display a concise view, enter the following command:

```
lssyslogserver -delim :
```

To display a detailed view of a syslog server, enter the following command:

```
lssyslogserver syslog_server_name
```

Setting up call home with email notifications

Call home with email notification sends notifications through a local email server to support and local users or services that monitor activity on the system. With email notifications, you can send notifications to IBM support and designate internal distribution of notifications as well, which alerts internal personnel of potential problems. Call home with email notifications require configuration of at least one email server and local users.

However, external notifications to the support center can be dropped if filters on the email server are active. To eliminate this problem, call home with email notifications is not recommended as the only method to transmit notifications to the support center. Call home with email notifications can be configured with cloud services for redundancy and internal management of notifications. If you also want notifications sent to an internal user or server, you must set up email notifications.

Using the management GUI

If you did not configure call home during system setup, you can configure this function in the management GUI. You can also change or update current settings on the **Call Home** page.

Note: Call home with email notifications can also be configured or updated by selecting **Settings > Notifications > Email**.

To configure or update call home with email notifications, complete these steps:

1. In the management GUI, select **Settings > Support > Call Home**.

2. On the **Call home** page, select **Send data with Call home email notifications** and click **Edit**.

Note: Email filters can drop notifications and responses to and from the support center which can impact resolution times for problems on your system. This transmission method is not recommended as the only way to send notifications to the support center. Use Call home with email notifications as a backup method when Call home with cloud services is configured.

3. Under **Email Servers**, enter a valid IP address and ports for up to 6 email servers in your network. These email servers send notification to the support center and receive and distribute responses from the support center.

4. Under **Call home**, verify the email address for the support center and select the type of notifications that you want to be sent to the support center.

5. Under **Email User**, enter a valid email address for a business-to-business contact and select the type of notifications that you want them to receive. To comply with privacy regulations, personal contact information for individuals within your organization is not recommended.

6. Under **Additional Settings**, enter your preferences for inventory intervals and configuration reporting. Inventory reports can be configured with call home and provide additional information to support personnel. An inventory report summarizes the hardware components and configuration of a system. Support personnel can use this information to contact you when relevant updates are available or when an issue that can affect your configuration is discovered. By default, these reports include configuration data that support personnel can use to automatically generate recommendations that are based on your actual configuration. You can have sensitive data removed from these reports, if necessary.

7. Click **Save**.

Using the command-line interface

You can use the command-line interface (CLI) to configure call home with email notification to specified recipients and your support center. To configure call home with email notifications, complete the following steps:

1. Define email servers to send email notifications to the support center by entering the following command:

```
mkemailserver -ip ip_address -port port_number
```

where *ip_address* specifies the IP address of a remote email server and *port_number* specifies the port number for the email server. Up to six email servers can be configured to provide redundant access to the external email network.

2. Define the support contact for email notifications by entering the following command:

```
mkemailuser -usertype support
```

In this command, the support contact address is automatically configured based on your geography and other support information that is related to your account. When you define the support contact for Call Home with email notifications, critical events, inventory reports, and configuration data are automatically configured and sent to the support center with notification. You can update inventory intervals and configuration data settings by using **chsystem** command.

3. Define any local entities within your organization that you want to receive notifications by entering the following command:

```
mkemailuser -address user_address  
-error on -usertype local
```

where *user_address* is a valid email address for a business-to-business contact. To comply with privacy regulations, personal contact information for individuals within your organization is not recommended. When a local user is defined, email notifications that are sent to the support center are also sent to the local user.

4. If you defined a local user in step “3” on page 84, ensure that contact information is defined so support personnel can follow-up on email notifications that are received at the support center.

```
chemail -reply reply_user_address -contact contact_name
        -primary primary_telephone_number -location location
```

Other optional values can be defined for with the **chemail** command. However, before the email server and notifications can be started when local users are defined, you must include following variables: *reply_user_address*, which is the email address for the user that is defined in step “3” on page 84, *contact_name*, *primary_telephone_number*, and *location*.

5. Start the email server and notification by entering the following command:

```
startemail
```

Setting up email servers by using the CLI

You can set up email server objects by using the command-line interface (CLI).

About this task

You can specify a server object that describes a remote Simple Mail Transfer Protocol (SMTP) email server to receive event notifications from the clustered system. You can specify up to six servers to receive notifications. To configure and work with email servers, use the following commands:

Procedure

1. Use the **mkemailserver** CLI command to create an email server object that describes a remote Simple Mail Transfer Protocol (SMTP) email server.

For example, enter the following CLI command to set up an email server:

```
mkemailserver -ip ip_address
```

where *ip_address* is the IP address of a remote email server. This address must be a valid IPv4 or IPv6 address.

2. To change the parameters of an existing email server object, use the **chemailserver** command. For example, to change the parameters of an email server, enter the following command:

```
chemailserver -ip ip_address email_server_name_or_id
```

where *ip_address* is the IP address of the email server object and *email_server_name_or_id* is the name or ID of the server object to be changed.

3. To delete a specified email server object, use the **rmemailserver** command. For example, to delete an email server, enter the following command:

```
rmemailserver email_server_name_or_id
```

4. To display either a concise list or a detailed view of email servers that are configured on the system, use the **lsemailserver** command.

For example, to display a concise view, enter the following command:

```
lsemailserver -delim :
```

To display a detailed view of an email server, enter the following command:

```
lsemailserver email_server_name_or_id
```

Changing user passwords using the CLI

You can use the command-line interface (CLI) to change user passwords.

About this task

Passwords control access to these applications:

- System management GUI
- Service assistant GUI
- CLI

Follow these steps to change the password for a user:

Procedure

Enter the following command to change the password:

```
chuser -password 'cleartextpassword' janedoe
```

Where *password* is the new password that you want to use for the user *janedoe*.

What to do next

Changing the locale setting using the CLI

You can use the command-line interface (CLI) to specify the locale for a system. The language that you select as your locale setting is used to display command results and error messages in the CLI.

About this task

The following locales are available:

- 0 US English (default)
- 3 Japanese

Procedure

Issue the **setlocale** CLI command with the ID for the locale.

Example

For example, issue the following CLI command to change the locale setting from US English to Japanese:

```
setlocale -locale 3
```

where 3 is the ID for the Japanese locale setting.

Viewing the feature log using the CLI

You can use the command-line interface (CLI) to view the feature log.

About this task

Perform the following steps to view the feature log:

Procedure

1. Issue the **lsdumps** command to return a list of dumps in the `/dumps/feature` destination directory. The feature log is maintained by the cluster. The feature log records events that are generated when license parameters are entered or when the current license settings have been breached.

2. Issue the **lsdumps** command to return a list of the files that exist of the type specified on the given node.

Analyzing the error log using the CLI

You can use the command-line interface (CLI) to analyze the error log (event log).

About this task

Perform the following step to analyze the error log:

Procedure

Issue the following CLI command to list error log entries by file type: **lseventlog**

Results

This command lists the error log entries. You can filter by type; for example, `lseventlog -filtervalue object_type=mdisk` displays the error log by managed disks (MDisks).

You can display the whole log or filter the log so that only errors, events, or unfixed errors are displayed. You can also request that the output is sorted either by error priority or by time. For error priority, the most serious errors are the lowest-numbered errors. Therefore, the most serious errors are displayed first in the table. For time, either the older or the latest entry can be displayed first in the output.

Shutting down a system by using the CLI

You can use the command-line interface (CLI) to shut down a system.

Procedure

To power off your system, complete the following steps.

1. Determine which hosts have access to volumes on this system by running the **lshostvdiskmap** command.
2. Stop input/output (I/O) to the system from each host that is listed in step “1” on page 87.

Note: Failure to stop host I/O can result in failed I/O operations being reported to your host operating systems.

3. Shut down the system by using this command:

```
stopsystem
```

4. Wait for the power light-emitting diodes (LEDs) on all nodes to flash at 1 Hz, indicating that the shutdown operation has completed.

Figure 1. Location of the power LED on a node canister

- 1 Power
- 2 Status
- 3 Fault

5. Disconnect the power cords from both power supplies in each node.

6. Disconnect the power cords from both power supplies in each expansion enclosure.

Updating the system automatically using the CLI

You can use the command-line interface (CLI) to install software updates.

Before you begin

Follow these steps to update to version 8.1.0 or later from version 7.7.0 or later.

To update from version 5.1.x or earlier, see the relevant IBM Knowledge Center or publications that are available at this website: www.ibm.com/support

If you encounter a memory DIMM failure to any node during the update process, stop immediately and follow directions in Updating the system.

You can use the command-line interface to resolve multipathing issues when nodes go offline for updates. You can add the ability to override the default 30 minute mid-point delay, pause an update, and resume a stalled update by following these steps:

1. To start an update but pause at the halfway point, enter the following command:

```
applysoftware -file filename -pause
```

2. To start an update but then pause before you take the node offline for an update, enter the following command:

```
applysoftware -file filename -pause -all
```

3. To resume a stalled update and pause at the halfway point, enter the following command:

```
applysoftware -resume -pause
```

4. To resume a stalled update and pause before you take the remaining nodes offline for an update, enter the following command:

```
applysoftware -resume -pause -all
```

Note: The **-all** parameter enables the update to pause indefinitely before each node goes offline for an update. This pause happens before the existing object-dependent volume check is carried out. The **-resume** parameter enables the user to continue the update.

Important: If you update your system software to version 8.1.1 or later from a version earlier than 8.1.0, on a system where you have already installed more than 64 GB of RAM, all nodes return from the update with an error code of 841. Versions 8.1.0 and later allocate memory in a different way than previous versions, so the RAM must be "accepted" again. To resolve the error, complete the following steps:

1. On a single node, run the **svctask chnodehw** command. Do not run the command on more than one node at a time.
2. Wait for the node to restart and return without the error.
3. Wait an additional 30 minutes for multipath drives to recover on the host.
4. Repeat this process for each node individually until you clear the error on all nodes.

About this task

To update the system, follow these steps:

Procedure

1. You must download, install, and run the latest version of the test utility to verify that no issues exist with the current system.

Important: After you install and run the test utility by using either the management GUI or the CLI, you must return to step “2” on page 89 on this page.

You can download and install the most current version of this tool at the following website. The link provides instructions for using either the management GUI or the CLI to install and run the test utility.

<http://www.ibm.com/support/docview.wss?uid=ssg1S4000585>

2. Download the latest code from the www.ibm.com/support site.

- If you want to write the code to a CD, you must download the CD image.
- If you do not want to write the code to a CD, you must download the installation image.

3. Use PuTTY scp (pscp) to copy the update files to the node.

4. Ensure that the update file was successfully copied.

Before you begin the update, you must be aware of the following situations:

- The installation process fails under the following conditions:
 - If the code that is installed on the remote system is not compatible with the new code or if an intersystem communication error does not allow the system to check that the code is compatible.
 - If any node in the system has a hardware type that is not supported by the new code.
 - If the system determines that one or more volumes in the system would be taken offline by rebooting the nodes as part of the update process. You can find details about which volumes would be affected by using the **lsdependentvdisks** command. If you are prepared to lose access to data during the update, you can use the force flag to override this restriction.
- The update is distributed to all the nodes in the system by using internal connections between the nodes.
- Nodes are updated one at a time.
- Nodes run the new code concurrently with normal system activity.
- While the node is updated, it does not participate in I/O activity in the I/O group. As a result, all I/O activity for the volumes in the I/O group is directed to the other node in the I/O group by the host multipathing software.
- There is a thirty-minute delay between node updates. The delay allows time for the host multipathing software to rediscover paths to the nodes that are updated. There is no loss of access when another node in the I/O group is updated.
- The update is not committed until all nodes in the system are successfully updated to the new code level. If all nodes are successfully restarted with the new code level, the new level is committed. When the new level is committed, the system vital product data (VPD) is updated to reflect the new code level.
- Wait until all member nodes are updated and the update is committed before you invoke the new functions of the updated code.
- Because the update process takes some time, the installation command completes as soon as the code level is verified by the system. To determine when the update is completed, you must either display the code level in the system VPD or look for the **Software update complete** event in the error/event log. If any node fails to restart with the new code level or fails at any other time during the process, the code level is backed off.
- During an update, the version number of each node is updated when the code is installed and the node is restarted. The system code version number is updated when the new code level is committed.
- When the update starts, an entry is made in the error or event log and another entry is made when the update completes or fails.

5. Issue this CLI command to start the update process:

```
applysoftware -file software_update_file
```

Where *software_update_file* is the name of the code update file in the directory you copied the file to in step “3” on page 89. If the system identifies any volumes that would go offline as a result of rebooting the nodes as part of the system update, the code update does not start. An optional **force** parameter can be used to indicate that the update continues regardless of the problem identified. If you use the **force** parameter, you are prompted to confirm that you want to continue. The behavior of the **force** parameter changes, and it is no longer required when you apply an update to a system with errors in the event log.

6. If you are updating from a release before version 7.4.0, issue the following CLI command to check the status of the code update process:

```
svcinfolsoftwareupgradestatus
```

This command displays **inactive** when the update is complete.

Note: If a status of **stalled_non_redundant** is displayed, proceeding with the remaining set of node updates might result in offline volumes. Contact a service representative to complete the update.

7. If you are updating from version 7.4.0 or later, issue the following CLI command to check the status of the code update process:

```
lsupdate
```

This command displays **success** when the update is complete. If you have hot-spare nodes that are configured on your system, the hot-spare node assumes I/O operations from each node as it is updated.

Note: If a status of **stalled_non_redundant** is displayed, proceeding with the remaining set of node updates might result in offline volumes. Contact a service representative to complete the update.

8. If you updated from a release before version 7.4.0, you receive the status message **system_completion_required**.

To complete the update process, issue the command **applysoftware -complete**. After that command is run, you can run **lsupdate** to see the progress of the update completion.

9. To verify that the update successfully completed, issue the **lsnodevpd** CLI command for each node that is in the system.

The code version field displays the new code level.

Results

When a new code level is applied, it is automatically installed on all the nodes that are in the system.

Note: An automatic system update can take up to 30 minutes per node.

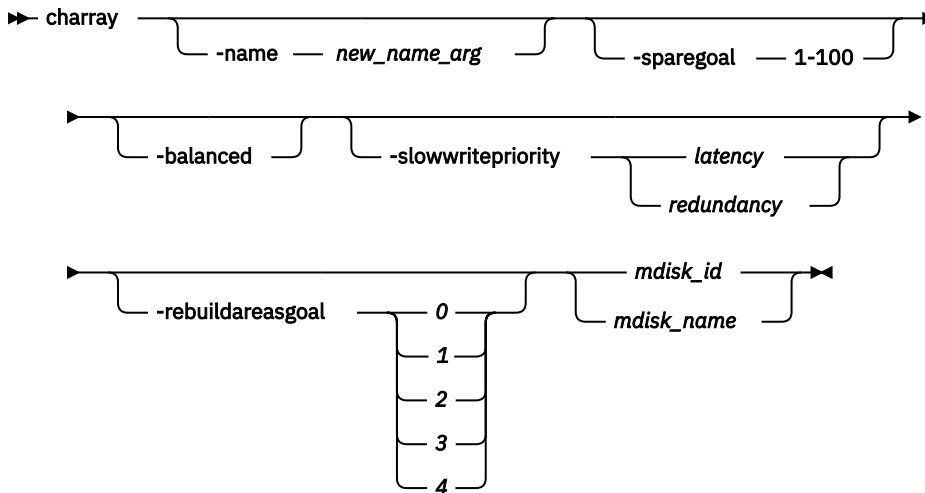

Chapter 3. Array commands

Use the array commands to manage arrays and their properties.

charray

Use the **charray** command to change array attributes.

Syntax

Parameters

-name *new_name_arg*

(Optional) Specifies the new name to apply to the array MDisk.

-sparegoal *1-100*

(Optional) Sets the number of spares to protect the array members with. The value can be a number between 1 and 100.

Note: This parameter is not applicable for distributed arrays.

-balanced

(Optional) Forces the array to balance and configure the spare goals of the present drives.

Specify **-balanced** and the system examines the membership's chain balance for mirrored arrays. If each mirrored member is on a different chain than its partner member, the array continues balancing the member chains. If each mirrored member is not on a different chain than its partner member, the array stops balancing the member chains.

Note:

- If **-balanced** is specified and the goal of the associated array MDisk changes, the tier of the array MDisk is updated to match the new goal.
- This parameter is not applicable for distributed arrays.

-slowwritepriority *latency* | *redundancy*

(Optional) Controls array ability to complete write operations that take too long, even if it temporarily compromises redundancy.

The value can be either *latency* or *redundancy*:

- *latency* implies the feature is enabled for normal I/O operations
- *redundancy* implies the feature is not enabled for normal I/O operations

The default value is `latency` mode for existing arrays, unless the array is RAID-0 (in which case redundancy mode is required).

Important: Do not change the mode of a RAID-0 array.

Important: An array can cause member drives to become unsynchronized (to preserve response time) if the value is `latency`. If the value is `redundancy`, the array cannot cause member drives to become unsynchronized (to preserve time) and I/O performance is impacted.

-rebuildareagoal 0 / 1 / 2 / 3 / 4

(Optional) Specifies the rebuild areas threshold. The array logs an error when the available rebuild areas drop below this specified threshold. The values are 0, 1, 2, 3, or 4. (If you specify 0, an error is not logged if the system runs out of rebuild areas.)

Note: This parameter is only applicable for distributed arrays.

mdisk_id / mdisk_name

(Required) Identifies (by ID or user-defined name) which array the MDisk command applies to.

Description

This command changes an array's attributes.

An invocation example to change the name of an array

```
charray -name raid6 mdisk0 0
```

The resulting output:

```
No feedback
```

An invocation example to set the number of spares threshold to 2

```
charray -sparegoal 2 mdisk52
```

The resulting output:

```
No feedback
```

An invocation example to balance the array

```
charray -balanced 3
```

The resulting output:

```
No feedback
```

An invocation example for changing the rebuild areas goal for an array

```
charray -rebuildareagoal 3 array1
```

The resulting output:

```
No feedback
```

An invocation example for changing the rebuild areas goal for an array

```
charray -slowwritepriority redundancy 0
```

The resulting output:

No feedback

Use the **lsarraymembergoals** command to list the spare goals for member drives of one or more array MDisks.

[lsarraymemberprogress](#)

Use the **lsarraymemberprogress** command to display array member background process status.

[lsarrayrecommendation](#)

Use the **lsarrayrecommendation** command to view a recommended configuration for the specified drive class and number of drives.

[lsarraysyncprogress](#)

Use the **lsarraysyncprogress** command to display how synchronized a RAID array is.

[lscompatibledriveclasses](#)

Use the **lscompatibledriveclasses** command to display all compatible drive class IDs for a given existing drive class.

[lspotentialarraysize](#)

Use the **lspotentialarraysize** command to display the size of a potential array for a specified drive count, drive class, and RAID level in the specified MDisk group.

[mkarray](#)

Use the **mkarray** command to create an MDisk array and add it to a storage pool. This command applies to nondistributed arrays. (Use the **mkdistributedarray** command to create distributed arrays).

[mkdistributedarray](#)

Use the **mkdistributedarray** command to create a distributed array and add it to a storage pool. (Use the **mkarray** command to create nondistributed arrays).

[recoverarray](#)

Use the **recoverarray** command to recover a specific corrupted array when you recover from either a T3 or when both nodes in an I/O group are removed.

[recoverarraybycluster](#) (Discontinued)

Attention: The **recoverarraybycluster** command has been discontinued. Use the **recoverarraybysystem** command instead.

recoverarraybysystem

Use the **recoverarraybysystem** command to recover corrupted arrays from either a T3 or when both nodes in an I/O group are removed.

rmarray

Use the **rmarray** command to remove an array MDisk from the configuration.

charraymember

Use the **charraymember** command to modify an array member's attributes, or to swap (exchange) a member of a RAID array with that of another drive.

Syntax

Parameters

-member *member_id*

Identifies the array member index.

-balanced

(Optional) Forces the array member spare goals to be set to the:

- Present array member goals
- Existing exchange goals
- The newDrive goals

Note: If **-balanced** is specified and the goal of the associated array MDisk changes, the tier of the array MDisk is updated to match the new goal.

-newdrive *new_drive_id*

(Optional) Identifies the drive to add to the array.

For distributed arrays:

- If the **-newdrive** parameter is specified with the **-immediate** parameter, and the member is not associated with a rebuild area, the command begins a distributed rebuild to a rebuild area in such a way that a copyback begins immediately when the rebuild finishes.
- If the **-newdrive** parameter is specified and the member is already associated with a rebuild area, the array configures itself to use the new member, and might begin a copyback. It occurs whether the **-immediate** parameter is specified or not.
- If the **-immediate** parameter is not set and the **-newdrive** parameter is set (but the array member is not allocated to a rebuild area), the command fails. If the **-balanced** parameter is set, the command fails.

- The **-newdrive** parameter is not allowed when an array expansion is in progress.

-immediate

(Optional) Specifies that the old disk is to be immediately removed from the array, and the new disk rebuilt. If you do not choose this option, exchange is used; it preserves redundancy during the rebuild.

-unbalanced

(Optional) Forces the array member to change if the newDrive does not meet array member goals.

mdisk_id

(Either the ID or the name is required) Identifies which ID array the MDisk command applies to.

mdisk_name

(Either the ID or the name is required) Identifies which name array the MDisk command applies to.

Description

This command modifies an array member's attributes, or swaps a member of a RAID array with a member of another drive.

Remember: You cannot create an array that contains an NVMe drive and another drive of a different technology type or transport protocol. If the member is an online compressed drive, then upon completion of the exchange, it is formatted and then become a candidate drive.

Specify **-balanced** and the system examines the mirrored pair that contains the member (including the new member drive's properties). If the array is mirror-based and the new drive is:

- On the same chain as the other member of this pair, it removes the chain-balancing goal from the array.
- Not on the same chain as the other member of this pair (and there is only one mirrored pair) the array becomes chain-balanced.

Because **charraymember** is member focused, this command operates locally to the member being operated on in terms of interacting with the new chain balanced goal.

This table shows the command combination options.

<i>Table 13. charraymember combination options</i>	
Option	Description
-balanced	<ul style="list-style-type: none"> • Member goals are set to the properties of the existing member or exchange drive. • The command fails if the member is not populated with a drive. • Member goals are set to the properties of the current member drives being exchanged into the array count as members. • If no exchange exists, the existing member drive goals are used.
-newdrive drive_id	<ul style="list-style-type: none"> • The command processes the exchange, and does NOT update the member goals. • You must specify a new drive that is an exact match for the member goals. • The command fails if the drive is not an exact match.
-newdrive drive_id -balanced	The command processes the exchange and updates the member goals to the properties of the new drive.
-newdrive drive_id -unbalanced	<ul style="list-style-type: none"> • The command processes the exchange and does NOT update the member goals. • It is only permitted when the array is degraded and the member is empty. • It means -immediate is not needed. The exchange is always immediate. • Later, if drives are a sufficient member goal match, the array rebalance selects those drives. • A balancing exchange restarts the member goals.

An invocation example to swap a spare or candidate drive for a member 0 drive by using exchange

```
charraymember -member 0 -newdrive 4 mdisk2
```

The resulting output:

```
No feedback
```

An invocation example to swap a spare or candidate drive for a member 1 drive and start component rebuild for the new member

```
charraymember -member 1 -newdrive 3 -immediate mdisk3
```

The resulting output:

```
No feedback
```

An invocation example to swap in a spare or candidate drive for member index 2

If there is a drive present, the exchange occurs:

```
charraymember -member 2 -newdrive 4 mdisk4
```

The resulting output:

```
No feedback
```

An invocation example to force member 4 to change its spare goals to its associated drive

```
charraymember -member 4 -balanced mdisk6
```

The resulting output:

```
No feedback
```

An invocation example to force an exchange and make the array change its goals to the new drive

```
charraymember -member 3 -newdrive 9 -balanced mdisk5
```

The resulting output:

```
No feedback
```

An invocation example to force an unbalancing exchange when drive 8 does not match the goals

```
charraymember -member 2 -newdrive 8 -unbalanced mdisk5
```

The resulting output:

```
No feedback
```

An invocation example to force an immediate exchange and make the array change its goals to the new drive

```
charraymember -member 3 -newdrive 9 -balanced -immediate mdisk5
```

The resulting output:

```
No feedback
```

An invocation example to change member 24 for new drive 15 by using a distributed rebuild to a rebuild area

```
charraymember -member 24 -newdrive 15 -immediate 0
```

The resulting output:

```
No feedback
```

[mkdistributedarray](#)

Use the **mkdistributedarray** command to create a distributed array and add it to a storage pool. (Use the **mkarray** command to create nondistributed arrays).

recoverarray

Use the **recoverarray** command to recover a specific corrupted array when you recover from either a T3 or when both nodes in an I/O group are removed.

recoverarraybycluster (Discontinued)

Attention: The **recoverarraybycluster** command has been discontinued. Use the **recoverarraybysystem** command instead.

recoverarraybysystem

Use the **recoverarraybysystem** command to recover corrupted arrays from either a T3 or when both nodes in an I/O group are removed.

rmarray

Use the **rmarray** command to remove an array MDisk from the configuration.

expandarray

Use the **expandarray** command to add new drive capacity to an existing distributed array MDisk.

Syntax

```
➤ expandarray — -totaldrivecount — resulting_drive_count ➔
```

```
└─ -driveclass — drive_class_id ┘
```

```
└─ -totalrebuildareas — resulting_rebuild_area_count ┘ └─ mdisk_id ┘
```

```
└─ mdisk_name ┘
```

Parameters

totaldrivecount

(Required) The resulting drive count after expansion is completed. This value must be an integer in the range of 5 and 128.

driveclass

(Optional) The drive class (as specified by **lsdriveclass**) to be used for selecting new member drives. If you do not specify a drive class, the default drive class is the one quoted in **lsarray** for the distributed array.

totalrebuildareas

(Optional) The resulting rebuild area count after expansion is completed. The additional rebuild area value must be included in **totaldrivecount**. This value must be an integer in the range of 1 and 4. If you do not specify a value, the rebuild area count for the array remains unchanged, even if the total drive count exceeds a threshold where the default array creation behavior would result in creating an extra rebuild area.

mdisk_id

(Optional) The identity of the array MDisk. Required if **mdisk_name** is not specified.

mdisk_name

(Optional) The name of the array MDisk. Required if **mdisk_id** is not specified.

Description

This command starts the array expansion task.

Important: The **-totaldrivecount** value includes any extra drives that are added as rebuild areas.

This list describes some items to be aware of when you expand an array:

- Multiple expansions are not configured and queued. The maximum number of active expansions in the system is four and there can be only one in a pool at one time.
- The command uses the **totaldrivecount/totalrebuildareas** to ensure that if a mistake occurs and the current size of the array is entered then the command has no effect.
- If no drive class is specified, then the drive class of the array you are expanding is used. If a drive class is specified, then it is validated to ensure it is equivalent or superior to the drive class of the array you are expanding.
- The array must have no used rebuild areas or background tasks in progress or the command fails.
- The progress of the expansion can be monitored by using the **lsarrayexpansionprogress** command.
- An expansion cannot be cancelled.
- Volume copies with sequential (seq) policy that are allocated from the expanding MDisk change to striped as part of the expansion migration.
- Expansion can have an impact on host performance and latency when performed on an array that has over 50% load.

An expansion is suspended if any of the following conditions exist:

- The expanding MDisk goes offline.
- There is a read error during migration activity.
- It is necessary (but not possible) to record a virtual medium error.
- An out of space condition occurs on an MDisk that is used as an expansion migration target.

Invocation examples

```
svctask expandarray -totaldrivecount 8 mdisk3           // Expand mdisk3 to 8 drives
from the array's driveclass
svctask expandarray -totaldrivecount 6 -totalrebuildareas 2 32 // Expand mdisk 32 to 6
drives, 2 of which being rebuild areas
svctask expandarray -driveclass 0 -totaldrivecount 16 48 // Expand mdisk 48 to 16
drives from drive class 0
```

The resulting output:

```
None
```

lsarrayrecommendation

Use the **lsarrayrecommendation** command to view a recommended configuration for the specified drive class and number of drives.

lsarraysyncprogress

Use the **lsarraysyncprogress** command to display how synchronized a RAID array is.

lscompatibledriveclasses

Use the **lscompatibledriveclasses** command to display all compatible drive class IDs for a given existing drive class.

lspotentialarraysize

Use the **lspotentialarraysize** command to display the size of a potential array for a specified drive count, drive class, and RAID level in the specified MDisk group.

mkarray

Use the **mkarray** command to create an MDisk array and add it to a storage pool. This command applies to nondistributed arrays. (Use the **mkdistributedarray** command to create distributed arrays).

mkdistributedarray

Use the **mkdistributedarray** command to create a distributed array and add it to a storage pool. (Use the **mkarray** command to create nondistributed arrays).

recoverarray

Use the **recoverarray** command to recover a specific corrupted array when you recover from either a T3 or when both nodes in an I/O group are removed.

recoverarraybycluster (Discontinued)

Attention: The **recoverarraybycluster** command has been discontinued. Use the **recoverarraybysystem** command instead.

recoverarraybysystem

Use the **recoverarraybysystem** command to recover corrupted arrays from either a T3 or when both nodes in an I/O group are removed.

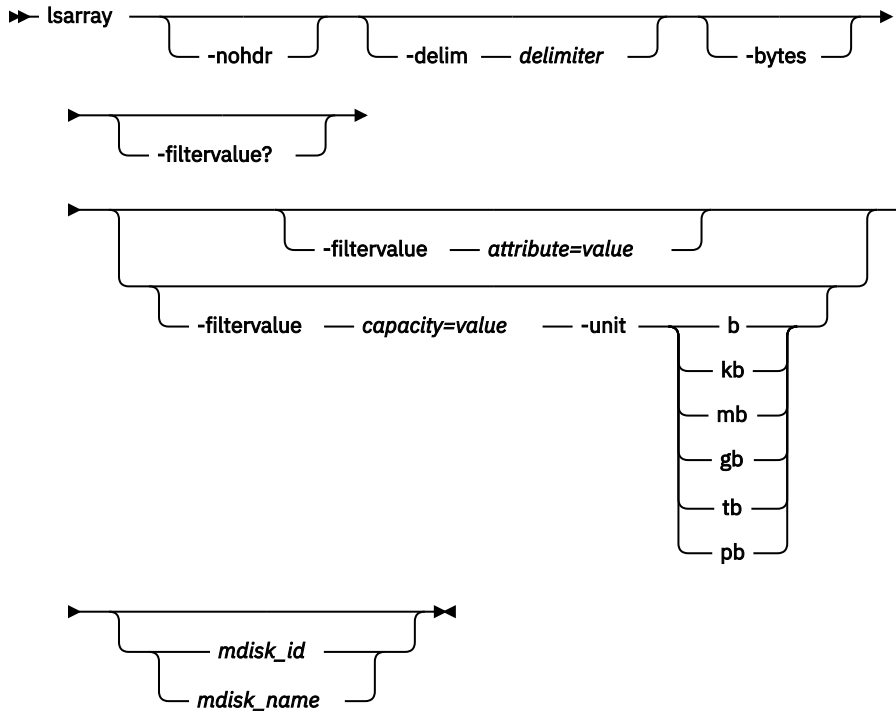

rmarray

Use the **rmarray** command to remove an array MDisk from the configuration.

lsarray

Use the **lsarray** command to list the array MDisks.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. In a detailed view, the data is separated from its header by the specified delimiter.

-bytes

(Optional) Requests output of capacities in bytes (instead of rounded values).

-filtervalue?

(Optional) Includes all of the valid filter attributes in the report. The following filter attributes are valid for the **lsarray** command:

- balanced
- capacity
- distributed
- mdisk_id
- mdisk_name
- mode

- `mdisk_grp_id`
- `mdisk_grp_name`
- `fast_write_state`
- `raid_status`
- `raid_level`
- `redundancy`
- `spare_goal`
- `spare_protection_min`
- `status`
- `strip_size`
- `tier`
- `easy_tier_load`

Any parameters that are specified with the `-filtervalue?` parameter are ignored.

-filtervalue attribute=value

(Optional) Specifies a list of one or more filter attributes match the specified values; see **-filtervalue?** for the supported attributes. Only objects with a value that matches the filter attribute value are returned. If capacity is specified, the units must also be included. Use the **unit** parameter to interpret the value for size or capacity.

Note: Some filters allow the use of a wildcard when you enter the command. The following rules apply to the use of wildcards when you use the CLI:

- The wildcard character is an asterisk (*).
- The command can contain a maximum of one wildcard, which must be the first or last character in the string.
- When you use a wildcard character, you must enclose the filter entry within double quotation marks (" "):

```
lsarray -filtervalue "name=md*"
```

-filtervalue capacity=value

(Optional) Specifies a list of one or more filter capacities (size) values matching the specified values for the **unit** parameter. Use the **unit** parameter to interpret the value for size or capacity.

-unit b | kb | mb | gb | tb | pb

(Optional) The units that are used when you specify the **-filtervalue** capacity, where:

- *b* = bytes
- *kb* = 1,024 bytes
- *mb* = 1,048,576 bytes
- *gb* = 1,073,741,824 bytes
- *tb* = 1,099,511,627,776 bytes
- *pb* = 1,125,899,906,842,624 bytes

mdisk_id

(Optional) The identity of the array MDisk.

mdisk_name

(Optional) The name of the array MDisk.

Description

This command returns a concise list or a detailed view of array MDisks visible to the system. This table provides the attribute values that can be displayed as output view data.

Table 14. Array output

Attribute	Values
capacity	Indicates the value for the capacity you specify by using the -unit parameter.
status	Indicates the array status. The values are: <ul style="list-style-type: none"> • online • offline • excluded • degraded (applies only to internal MDisks)
mode	Indicates the mode. The values are: <ul style="list-style-type: none"> • unmanaged • managed • image • array
quorum_index	Indicates the quorum index. The values are: <ul style="list-style-type: none"> • 0 • 1 • 2 • Blank if the MDisk is not being used as a quorum disk.
block_size	Indicates the block size. The value is 512 bytes (or blank) in each block of storage.
ctrl_type	4, 6, where 6 is a flash drive attached inside a node and 4 is any other device.
raid_status	Indicates the RAID status. The values are: <p>offline The array is offline on all nodes.</p> <p>degraded The array has deconfigured or offline members; the array is not fully redundant.</p> <p>syncing The array members are all online. The array is synchronizing parity or mirrors to achieve redundancy.</p> <p>initializing The array members are all online. The array is initializing; the array is fully redundant.</p> <p>online The array members are all online and the array is fully redundant.</p> <p>expanding The array members are all online and the array is expanding.</p>

Table 14. Array output (continued)

Attribute	Values
fast_write_state	<p>Indicates the cache state of the array. The values are:</p> <ul style="list-style-type: none"> • <code>empty</code>, which indicates that the array disk data is not changing. • <code>not_empty</code>, which indicates that the array disk data might change. • <code>corrupt</code>, which indicates that the array disk data is lost and the array is corrupt. <p>Repair can be initiated by using the recoverarray or recoverarraybysystem command.</p>
raid_level	<p>Indicates the RAID level of the array. The values are:</p> <ul style="list-style-type: none"> • <code>RAID0</code> • <code>RAID1</code> • <code>RAID5</code> • <code>RAID6</code> • <code>RAID10</code>
redundancy	Indicates the number of member disks that can fail concurrently without causing the array to fail.
enclosure_id	Indicates which enclosure the array belongs to.
strip_size	Indicates the strip size of the array (in KB).
spare_goal	Indicates the number of spares that the array members must be protected by. For distributed arrays, this value is blank.
spare_protection_min	Indicates the minimum number of spares that an array member is protected by. For distributed arrays, this value is blank.
balanced	<p>For nondistributed arrays, this value indicates whether the array is balanced to its spare goals:</p> <ul style="list-style-type: none"> • <code>exact</code> indicates that all populated members have the same (matching) capability and location. • <code>yes</code> indicates that all populated members have at least the same capability and chain, but a different enclosure or slot. • <code>no</code> indicates that it is unbalanced. <p>For distributed arrays, this value indicates whether a superior drive class is being used for the array:</p> <ul style="list-style-type: none"> • <code>exact</code> indicates that the same drive class is in use. • <code>yes</code> indicates that at least one array member exceeds the array drive class. <p>For distributed arrays, the array must also be balanced to its rebuild area goals.</p>

Table 14. Array output (continued)

Attribute	Values
tier	<p>Indicates the tier that this array is assigned to by auto-detection (for internal arrays) or by the user:</p> <ul style="list-style-type: none"> • tier0_flash • tier1_flash • tier_enterprise • tier_nearline • tier_scm <p>Note: Use the chmdisk command to change this value.</p>
replacement_date	Indicates the date of a potential array failure. The format must be YYMMDD.
easy_tier_load	<p>Indicates the value for Easy Tier settings, and is either blank (for arrays) or one of the following values (for MDisks):</p> <ul style="list-style-type: none"> • low • medium • high • very_high
slow_write_priority	<p>Indicates the response time goal:</p> <ul style="list-style-type: none"> • latency indicates that the array is taken out of synchronization to quickly complete write operations that take excessive time. • redundancy indicates slow write operations are completed in normal time and the arrays remain synchronized.
site_id	Indicates the site value for the storage pool. This numeric value is 1, 2, 3, or blank.
site_name	Indicates the site name for the storage pool. This value is alphanumeric or is blank.
fabric_type	<p>Indicates a Fibre Channel (FC), SAS, or another type of array.</p> <ul style="list-style-type: none"> • fc indicates an array from an FC controller. • sas_direct indicates an array from an SAS direct-attached controller.
encrypt	<p>Indicates whether the data that is stored on the array is encrypted or not encrypted. The possible values are:</p> <ul style="list-style-type: none"> • yes • no
distributed	Indicates whether the array is distributed. The values are yes or no.
drive_class_id	Indicates the drive class that makes up this array. If -allowsuperior was used during array creation, the lowest used drive class ID is displayed. This value is blank for nondistributed arrays.
drive_count	Indicates the total width of the array, including rebuild areas. The value is a number from 4 to 128. The minimum value for RAID-6 and RAID-10 arrays is 6.

Table 14. Array output (continued)

Attribute	Values
stripe_width	Indicates the width of a single unit of redundancy within a distributed set of drives. The values are: <ul style="list-style-type: none"> Any number from 3 - 16 for RAID-5 arrays. Any number from 4 - 16 for RAID-6 arrays. An even number from 2 - 16 for RAID-10 arrays.
rebuild_areas_total	Indicates the total number of rebuild areas set when the array is created. These rebuild areas provide performance but no capacity. The value is 1 - 4 for distributed array RAID-5 and distributed array RAID-6. The value is blank for nondistributed arrays.
rebuild_areas_available	Indicates the number of remaining rebuild areas within the set of drives. The value is 1 - 4 for distributed array RAID-5 and distributed array RAID-6. The value is blank for nondistributed arrays.
rebuild_areas_goal	Indicates the rebuild areas threshold (minimum limit) at which point the array logs an error. The value is 1 - 4 for distributed array RAID-5 and distributed array RAID-6. The value is blank for nondistributed arrays.
over_provisioned	Shows yes if the MDisk is thin-provisioned. Shows no if the disk is marked as standard-provisioned , resource-provisioned, or the information cannot be determined.
supports_unmap	Shows yes if the MDisk indicates UNMAP support. Shows no if the disk indicates it does not support UNMAP, or the information cannot be identified.
provisioning_group_id	System allocated identifier of the provisioning group that relates to the MDisk. This identifier is used to identify the list of MDisk that are provided by the same provisioning group.
physical_capacity	The total physical storage capacity of the provisioning group providing this MDisk. If this disk is not <code>over_provisioned</code> , then logical capacity is reported here.
physical_free_capacity	The amount of formatted available physical space in the provisioning group providing this MDisk. If this disk is not <code>over_provisioned</code> , then remaining logical capacity is reported here.
write_protected	Shows yes if the array is in the write protected state, otherwise no.
data_reduced	Indicates that the MDisk data is reduced. The values are yes or no.
effective_used_capacity	The amount of logical data that is written to the MDisk. If this MDisk is not <code>over_provisioned</code> , then this field is blank.
allocated_capacity	The amount of logical capacity that is allocated (by a pool) from this array for volume data and quorum.

This list defines the status fields:

online

The MDisk is online and available.

degraded

(Internal MDisk only) The array has members that are degraded, or the `raid_status` is degraded.

degraded_ports

There are one or more MDisk port errors.

degraded_paths

One or more paths to the MDisk are lost; the MDisk is not online to every node in the system.

offline

All paths to the MDisk are lost.

excluded

The MDisk is excluded from use by the system; the MDisk port error count exceeded the threshold.

A concise invocation example

```
lsarray -delim :
```

The resulting output:

```
mdisk_id:mdisk_name:status:mdisk_grp_id:mdisk_grp_name:capacity:raid_status:
raid_level:redundancy:strip_size:tier:encrypt

:distributed
1::online:0:mdiskgrp0:68.4GB:online:raid0:0:256:enterprise:no:yes

Use the **lscompatibledriveclasses** command to display all compatible drive class IDs for a given existing drive class.

[lspotentialarraysize](#)

Use the **lspotentialarraysize** command to display the size of a potential array for a specified drive count, drive class, and RAID level in the specified MDisk group.

[mkarray](#)

Use the **mkarray** command to create an MDisk array and add it to a storage pool. This command applies to nondistributed arrays. (Use the **mkdistributedarray** command to create distributed arrays).

[mkdistributedarray](#)

Use the **mkdistributedarray** command to create a distributed array and add it to a storage pool. (Use the **mkarray** command to create nondistributed arrays).

[recoverarray](#)

Use the **recoverarray** command to recover a specific corrupted array when you recover from either a T3 or when both nodes in an I/O group are removed.

[recoverarraybycluster](#) (Discontinued)

Attention: The **recoverarraybycluster** command has been discontinued. Use the **recoverarraybysystem** command instead.

recoverarraybysystem

Use the **recoverarraybysystem** command to recover corrupted arrays from either a T3 or when both nodes in an I/O group are removed.

rmdarray

Use the **rmdarray** command to remove an array MDisk from the configuration.

lsarrayexpansionprogress

Use the **lsarrayexpansionprogress** command to display the array expansion task status for one or more arrays.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. In a detailed view, the data is separated from its header by the specified delimiter.

-filtervalue?

(Optional) Includes all of the valid filter attributes in the report. The following filter attributes are valid for the **lsarrayexpansionprogress** command:

- mdisk_id
- mdisk_name
- progress
- estimated_completion_time
- mdisk_grp_name
- status
- target_capacity
- additional_capacity_remaining
- drives_added

Any parameters that are specified with the **-filtervalue?** parameter are ignored.

-filtervalue attribute=value

(Optional) Specifies a list of one or more filter attributes that match the specified values; see **-filtervalue?** for the supported attributes. Only objects with a value that matches the filter attribute value are returned. If capacity is specified, the units must also be included. Use the **unit** parameter to interpret the value for size or capacity.

Note: Some filters allow the use of a wildcard when you enter the command. The following rules apply to the use of wildcards when you use the CLI:

- The wildcard character is an asterisk (*).
- The command can contain a maximum of one wildcard, which must be the first or last character in the string.
- When you use a wildcard character, you must enclose the filter entry within double quotation marks.

mdisk_id

(Optional) The identity of the array MDisk.

mdisk_name

(Optional) The name of the array MDisk.

Description

This command returns a concise list of the array expansion task status for one or more arrays. If the ID or name parameter is not set, then all array MDisks currently expanding are displayed. If the parameter is set, then the view is displayed for that MDisk regardless if it is expanding or not. This table provides the attribute values that can be displayed as output view data.

<i>Table 15. Output</i>	
Attribute	Values
mdisk_id	Indicates the ID of the MDisk.
mdisk_name	Indicates the name of the MDisk.
progress	Indicates the progress of the expansion. This value is a number in the range of 0 - 100 or blank if no expansion is in progress.
estimated_completion_time	Indicates the estimated completion time for the expansion. This value is in the format of YYMMDDHHMMSS or blank if no expansion is in progress or the expansion is suspended.
status	Indicates the current status of the expansion.
target_capacity	Indicates the capacity of the array after the expansion process is completed. This value is in GB with two decimal places.
additional_capacity_remaining	Indicates the capacity that is added to the array (target capacity - current capacity). This value is in GB with two decimal places.
drives_added	Indicates the number of drives added.

This list defines the status fields:

blank

No expansion in progress.

inactive

No expansion in progress.

running

The expansion activity is proceeding normally.

offline

The expansion activity is suspended because the MDisk is offline.

suspended

The expansion activity is suspended because of an error. Fix the migration errors against the MDisk.

syncing

The expansion is suspended because the array is syncing.

An invocation example that lists all current expansions

```
svcinfolarrayexpansionprogress -delim :
```

The resulting output:

```
mdisk_id:mdisk_name:progress:estimated_completion_time:status:target_capacity:additional_capacity_remaining:drives_added
16:mdisk1:0:191225120000:running:31.79GB:7.95GB:1
32:mdisk2:20:100120132001:running:35.43GB:4.88GB:12
64:mdisk3:80:100120162401:running:67.34GB:16.54GB:3
96:mdisk4:59::offline:31.79GB:7.95GB:5
```

An invocation example for an MDisk not being expanded

```
svcinfolarrayexpansionprogress -delim : mdisk4 -nohrd
```

The resulting output:

```
96:mdisk4:100::inactive::
```

Use the **lsarraymembergoals** command to list the spare goals for member drives of one or more array MDisks.

lsarraymemberprogress

Use the **lsarraymemberprogress** command to display array member background process status.

lsarrayrecommendation

Use the **lsarrayrecommendation** command to view a recommended configuration for the specified drive class and number of drives.

lsarraysyncprogress

Use the `lsarraysyncprogress` command to display how synchronized a RAID array is.

lscompatibledriveclasses

Use the **lscompatibledriveclasses** command to display all compatible drive class IDs for a given existing drive class.

lspotentialarraysize

Use the **lspotentialarraysize** command to display the size of a potential array for a specified drive count, drive class, and RAID level in the specified MDisk group.

mkarray

Use the **mkarray** command to create an MDisk array and add it to a storage pool. This command applies to nondistributed arrays. (Use the **mkdistributedarray** command to create distributed arrays).

mkdistributedarray

Use the **mkdistributedarray** command to create a distributed array and add it to a storage pool. (Use the **mkarray** command to create nondistributed arrays).

recoverarray

Use the **recoverarray** command to recover a specific corrupted array when you recover from either a T3 or when both nodes in an I/O group are removed.

recoverarraybycluster (Discontinued)

Attention: The **recoverarraybycluster** command has been discontinued. Use the **recoverarraybysystem** command instead.

recoverarraybysystem

Use the **recoverarraybysystem** command to recover corrupted arrays from either a T3 or when both nodes in an I/O group are removed.

rmarrray

Use the **rmarrray** command to remove an array MDisk from the configuration.

lsarrayinitprogress

Use the **lsarrayinitprogress** command to view the progress of array background initialization that occurs after creation.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-filtervalue attribute=value

(Optional) Specifies a list of one or more filters. Only objects with a value that matches the filter attribute value are displayed.

Note: Some filters allow the use of a wildcard when you enter the command. The following rules apply to the use of wildcards:

- The wildcard character is the asterisk (*).
- The command can contain a maximum of one wildcard.
- When you use a wildcard, enclose the filter entry within double quotation marks (""):

```
lsarraysyncprogress -filtervalue mdisk_id="1★"
```

-filtervalue?

(Optional) Displays the valid filter attributes for the **-filtervalue** parameter:

- estimated_completion_time
- mdisk_id
- mdisk_name
- progress

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

mdisk_id

(Optional) The identity of the array MDisk.

mdisk_name

(Optional) The user-defined MDisk name.

Description

This command shows the progress of array background initialization. This table shows the possible outputs.

<i>Table 16. lsarrayinitprogress output</i>	
Attribute	Value
progress	The percentage of initialization task that is completed.
estimated_completion_time	The expected initialization task completion time, in YYMMDDHHMMSS format.

A concise invocation example

```
lsarrayinitprogress -delim :
```

The resulting output:

```
mdisk_id:mdisk_name:progress:estimated_completion_time
0:mdisk0:50:070301120000
1:mdisk1:51:070301130000
2:mdisk2:32:070301153500
```

A concise invocation (qualified with MDisk) example

```
lsarrayinitprogress -delim : mdisk2
```

The resulting output:

```
mdisk_id:mdisk_name:progress:estimated_completion_time
2:mdisk2:32:070301153500
```

An invocation example for an array that has finished initialization

```
lsarrayinitprogress -delim : mdisk4
```

The resulting output:

```
mdisk_id:mdisk_name:progress:estimated_completion_time
4:mdisk4:100:
```

Attention: The **recoverarraybycluster** command has been discontinued. Use the **recoverarraybysystem** command instead.

[recoverarraybysystem](#)

Use the **recoverarraybysystem** command to recover corrupted arrays from either a T3 or when both nodes in an I/O group are removed.

[rmarray](#)

Use the **rmarray** command to remove an array MDisk from the configuration.

lsarraylba

Use the **lsarraylba** command to permit an array logical block addressing (LBA) to be found from a drive and LBA.

Syntax

```
➔ lsarraylba -nohdr -delim delimiter -drivelba lba -drive drive_id ➔
```

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

-drivelba lba

The LBA on the drive to convert to the array LBA. The *lba* value must be specified in hex, with a 0x prefix.

-drive drive_id

The ID of the drive to view.

Description

This command permits an array LBA to be found on a drive and LBA.

The system provides volumes that have LBAs for 512-byte block sizes; however, back-end disks that have a block size of either 512 or 4096 bytes can also be used. Drives are listed in their physical size.

Use the **lsdrive** command to display the drive block size, and use the **lsdrive** or **lsarray** command to list each object (the drive and the MDisk).

During an expansion, if **lsarraylba** is used on a drive that is added to the array and the LBA specified on the command is below the crossover between the old and new geometry regions of the array then this

LBA is not allocated to the array. The command output lists this LBA as unallocated. Continued expansion activity eventually allocates this LBA.

This table shows possible outputs.

Table 17. <i>lsarraylba</i> output	
Attribute	Value
type	<p>The type of MDisk extent allocation:</p> <ul style="list-style-type: none"> • allocated • unallocated <p>For distributed arrays only:</p> <ul style="list-style-type: none"> • If the LBA is an unused rebuild area, this value displays <code>rebuild_area</code>. • If the LBA is a used rebuild area, this value displays <code>allocated</code>.
mdisk_lba	The LBA on the array MDisk (blank if none).
mdisk_start	The start of range of LBAs (strip) on the array MDisk (blank if none).
mdisk_end	The end of range of LBAs (strip) on the array MDisk (blank if none).
drive_start	The start of range of LBAs (strip) on the drive (blank if none).
drive_end	The end of range of LBAs (strip) on the drive (blank if none).

An invocation example to map drive 2 LBA -`xff` to MDisk 2 LBA `0xff`

```
lsarraylba -delim : -drive1lba 0xff -drive 2
```

The resulting output:

```
mdisk_id:mdisk_name:type:mdisk_lba:mdisk_start:mdisk_end:drive_start:drive_end
0:mdisk2:allocated:0x000000000000001ff:0x0000000000000100:0x0000000000001ff:
0x0000000000000000:0x00000000000000ff
```

An invocation example for an allocated space

```
lsarraylba -drive1lba 0x00 -drive 2
```

The resulting output:

```
mdisk_id mdisk_name type      mdisk_lba      mdisk_start      mdisk_end
drive_start      drive_end
1      mdisk1      allocated 0x0000000000000000 0x0000000000000000 0x00000000000001FF
0x0000000000000000 0x00000000000001FF
```

An invocation example for an unused rebuild area

```
lsarraylba -drive1lba 0x00 -drive 16
```

The resulting output:

```
mdisk_id mdisk_name type      mdisk_lba      mdisk_start      mdisk_end
drive_start      drive_end
3      mdisk3      rebuild_area
0x0000000000000000 0x0000000000000A1F
```

Use the **charray** command to change array attributes.

charraymember

Use the **charraymember** command to modify an array member's attributes, or to swap (exchange) a member of a RAID array with that of another drive.

expandarray

Use the **expandarray** command to add new drive capacity to an existing distributed array MDisk.

lsarray

Use the **lsarray** command to list the array MDisks.

lsarrayexpansionprogress

Use the **lsarrayexpansionprogress** command to display the array expansion task status for one or more arrays.

lsarrayinitprogress

Use the **lsarrayinitprogress** command to view the progress of array background initialization that occurs after creation.

lsarraymember

Use the **lsarraymember** command to list the member drives of one or more array MDisks.

lsarraymembergoals

Use the **lsarraymembergoals** command to list the spare goals for member drives of one or more array MDisks.

lsarraymemberprogress

Use the **lsarraymemberprogress** command to display array member background process status.

lsarrayrecommendation

Use the **lsarrayrecommendation** command to view a recommended configuration for the specified drive class and number of drives.

lsarraysyncprogress

Use the **lsarraysyncprogress** command to display how synchronized a RAID array is.

lscompatibledriveclasses

Use the **lscompatibledriveclasses** command to display all compatible drive class IDs for a given existing drive class.

lspotentialarraysize

Use the **lspotentialarraysize** command to display the size of a potential array for a specified drive count, drive class, and RAID level in the specified MDisk group.

mkarray

Use the **mkarray** command to create an MDisk array and add it to a storage pool. This command applies to nondistributed arrays. (Use the **mkdistributedarray** command to create distributed arrays).

mkdistributedarray

Use the **mkdistributedarray** command to create a distributed array and add it to a storage pool. (Use the **mkarray** command to create nondistributed arrays).

recoverarray

Use the **recoverarray** command to recover a specific corrupted array when you recover from either a T3 or when both nodes in an I/O group are removed.

recoverarraybycluster (Discontinued)

Attention: The **recoverarraybycluster** command has been discontinued. Use the **recoverarraybysystem** command instead.

recoverarraybysystem

Use the **recoverarraybysystem** command to recover corrupted arrays from either a T3 or when both nodes in an I/O group are removed.

rmarray

Use the **rmarray** command to remove an array MDisk from the configuration.

lsarraymember

Use the **lsarraymember** command to list the member drives of one or more array MDisks.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-filtervalue attribute=value

(Optional) Specifies a list of one or more filter attributes that matches the specified values; see **-filtervalue?** for the supported attributes.

Note: Some filters allow the use of a wildcard when you enter the command. The following rules apply to the use of wildcards when you use the CLI:

- The wildcard character is an asterisk (*).
- The command can contain a maximum of one wildcard, which must be the first or last character in the string.
- When you use a wildcard character, you must enclose the filter entry within double quotation marks (" "):

```
lsarraymember -filtervalue "mdisk_name=md*"
```

-filtervalue?

(Optional) Includes all of the valid filter attributes in the report. The following filter attributes are valid for the **lsarraymember** command:

- mdisk_id
- mdisk_name
- member_id
- drive_id
- new_drive_id
- spare_protection
- balanced

Any parameters specified with the **-filtervalue?** parameter are ignored.

-delim delimiter

(Optional) By default, in a concise view all columns of data are space-separated, with the width of each column set to the maximum width of each item of data. In a detailed view, each item of data is an individual row, and if headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. Enter **-delim :** on the command line, and the colon character (:) separates all items of

data in a concise view (for example, the spacing of columns does not occur); in a detailed view, the specified *delimiter* separates the data from its header.

mdisk_id

(Optional) The identity of the array MDisk.

mdisk_name

(Optional) The MDisk name that you provided.

Description

This command lists the member drives of one or more array MDisks. It describes positions within an array unoccupied by a drive. The positions determine how mirroring the RAID takes place. For example, determining whether x is mirrored to y for RAID-10, where parity starts from RAID-5, which is for enclosure-based systems only.

This table shows the potential output for this command.

<i>Table 18. lsarraymember output</i>	
Attribute	Value
member_id	Specifies the identity of the array member. It represents drive order in RAID array
drive_id	Specifies the identity of the drive for member ID, or the source drive if an exchange is in progress. It is blank if there is no drive that is configured.
new_drive_id	Specifies the ID of the drive that is exchanged with this member ID. It is blank if there is no ID.
spare_protection	Specifies the number of non-degrading spares for the member. This includes spare drives with different attributes from the array member goals that perform equally or better than the array member goals. For distributed array members this field is blank.
balanced	<p>For nondistributed arrays, this value describes if the array is balanced to its spare goals:</p> <ul style="list-style-type: none"> • exact indicates that all populated members have the same (matching) capability and location. • yes indicates that all populated members have at least the same capability and chain, but a different enclosure or slot. • no indicates that it is unbalanced. <p>For distributed arrays, this value indicates whether a superior drive class is being used for the array:</p> <ul style="list-style-type: none"> • exact indicates that the same drive class is in use. • yes indicates that the drive exceeds the array drive class. <p>For distributed arrays, the array must also be balanced to its rebuild area goals.</p>
slow_write_count	Indicates the number of times this member becomes unsynchronized because of high response time on write I/O operations.
slow_write_time_last	Creates a timestamp of when the component last became unsynchronized. The time format is YYMMDDhhmmss in clustered system time. No time is indicated if the value for slow_write_count is 0.

A concise invocation example

```
lsarraymember -delim :
```

The resulting output:

```
lsarraymember -delim :
mdisk_id:mdisk_name:member_id:drive_id:new_drive_id:spare_protection
      :balanced:slow_write_count:slow_write_time_last
2:mdisk1:0:55::1:exact:4:130103202158
2:mdisk1:1:56::1:exact:1:130103203930
2:mdisk2:0:0::2:exact:0:
2:mdisk2:1:2:5:3:exact:2:130103204044
2:mdisk2:2:::0:
2:mdisk2:3:8::0:no::
```

A concise invocation example (qualified with MDisk)

```
lsarraymember -delim : mdisk_2
```

The resulting output:

```
tmdisk_id:mdisk_name:member_id:drive_id:new_drive_id:spare_protection
      :balanced:slow_write_count:slow_write_time_last
2:mdisk2:0:0::2:exact:4:130103202158
2:mdisk2:1:2:5:3:exact:1:130103203930
2:mdisk2:2:::0:
2:mdisk2:3:8::0:no:2:130103204044
```

Note: From this output, you can see that:

- The array has four members (possibly a 4-member RAID-10 array). You cannot use RAID-10 with distributed arrays.
- The second array member is undergoing exchange for drive5.
- The third array member is not configured. It might be offline or failed, without a hot spare available.
- The fourth array member has no spare protection and is not balanced.

An invocation example (two arrays)

```
lsarraymember -delim :
```

The resulting output:

```
mdisk_id:mdisk_name:member_id:drive_id:new_drive_id:spare_protection
      :balanced:slow_write_count:slow_write_time_last
2:mdisk1:0:55::1:exact:4:130103202158
2:mdisk1:1:56::1:exact:1:130103203930
2:mdisk2:0:0::2:exact:0:
2:mdisk2:1:2:5:3:exact:2:130103204044
2:mdisk2:2:::0:
2:mdisk2:3:8::0:no::
```

An invocation example (an array with a change in membership from (55,56) to (55,57,58))

```
lsarraymember -delim : mdisk_3
```

The resulting output:

```
mdisk_id:mdisk_name:member_id:drive_id:new_drive_id:spare_protection
      :balanced:slow_write_count:slow_write_time_last
3:mdisk3:0:55::55:1:exact:4:130103202158
3:mdisk3:1:56::57:1:exact:1:130103203930
3:mdisk3:2:::58:1:exact:0:
```

An invocation example (an array with a change in membership from (55,57,58) to (55,56))

```
lsarraymember -delim : mdisk_3
```

The resulting output:

```
mdisk_id:mdisk_name:member_id:drive_id:new_drive_id:spare_protection
      :balanced:slow_write_count:slow_write_time_last
3:mdisk3:0:55::55:1:exact:4:130103202158
3:mdisk3:1:57::56:1:exact:1:130103203930
3:mdisk3:2:58::1:exact:0:
```

Attention: The **recoverarraybycluster** command has been discontinued. Use the **recoverarraybysystem** command instead.

recoverarraybysystem

Use the **recoverarraybysystem** command to recover corrupted arrays from either a T3 or when both nodes in an I/O group are removed.

rmarrray

Use the **rmarrray** command to remove an array MDisk from the configuration.

lsarraymembergoals

Use the **lsarraymembergoals** command to list the spare goals for member drives of one or more array MDisks.

Syntax

Parameters

-filtervalue attribute=value

(Optional) Specifies a list of one or more filters. Only objects with a value that matches the filter attribute value are displayed.

Note: Some filters allow the use of a wildcard when you enter the command. The following rules apply to the use of wildcards:

- The wildcard character is the asterisk (*).
- The command can contain a maximum of one wildcard.
- When you use a wildcard, enclose the filter entry within double quotation marks (""):
`lsarraymembergoals -filtervalue mdisk_id="1*"`

-filtervalue?

(Optional) Displays the valid filter attributes for the **-filtervalue** parameter:

- capacity_goal
- drive_id
- enclosure_id_goal
- estimated_completion_time
- mdisk_id
- mdisk_name
- member_id
- node_id_goal
- progress

- RPM_goal
- slot_id_goal
- tech_type_goal
- drive_class_id_goal
- compressed_goal
- transport_protocol_goal

-delim delimiter

(Optional) By default, in a concise view all columns of data are space-separated, with the width of each column set to the maximum width of each item of data. In a detailed view, each item of data is an individual row, and if it displays headers, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. Enter **-delim :** on the command line, and the colon character (:) separates all items of data in a concise view (for example, the spacing of columns does not occur); in a detailed view, the data is separated from its header by the *delimiter* you specify.

-bytes

(Optional) Requests output of capacities in bytes (instead of rounded values).

mdisk_id

(Optional) The identity of the array MDisk.

mdisk_name

(Optional) The MDisk name that you provided.

Description

This command lists the spare goals for member drives of one or more array MDisks. This table provides the potential output for this command.

<i>Table 19. lsarraymembergoals output</i>	
Attribute	Values
member_id	Indicates the ID of the array member that represents the drive order in the RAID array.
drive_id	Indicates the ID of the drive for the member ID (it is blank if none are configured).
capacity_goal	Indicates the capacity goal for the array member (it is the same for all members in the array).
tech_type_goal	Indicates the technology goal for the array member: <ul style="list-style-type: none"> • tier0_flash • tier1_flash • tier_enterprise • tier_nearline • tier_scm
RPM_goal	Indicates the drive RPM characteristic that the array member must have (it is blank for flash drives).
enclosure_id_goal	Indicates the ID of the enclosure that must contain the array member (it is blank if no enclosure is selected).
slot_id_goal	Indicates the ID of the slot in the enclosure that must contain the array member.
node_id_goal	Indicates the ID of the node that must contain this array member.

Table 19. **lsarraymembergoals** output (continued)

Attribute	Values
enclosure_balance_goal	Indicates whether a member drive's enclosure must be connected to the same SAS port as the drive that set the array goals.
block_size_goal	Indicates the array member block size. The value is either 512 or 4096. This value is the same for all member drives in the array, and is the smallest value for the block size of one of the original drives or the set of drives in the array when it is set to be balanced.
drive_class_id_goal	Indicates the preferred drive class for this array member (the value is blank for nondistributed arrays).
transport_protocol_goal	Indicates the transport protocol of the drive. Blank for Flashsystem V9000 AE1 and AE2 enclosures. The possible values are: <ul style="list-style-type: none"> • sas • nvme
compressed_goal	Indicates whether the drive is compressed.

An invocation example (a four-member RAID-10 SAS array that is split across chains)

You cannot use RAID-10 with distributed arrays.

```
lsarraymembergoals -delim : mdisk_2
```

The resulting output:

```
mdisk_id:mdisk_name:member_id:drive_id:capacity_goal:
tech_type_goal:RPM_goal:enclosure_id_goal:slot_id_goalenclosure_balance_goal:node_id_goal:block_
size_goal:drive_class_id_goal
2:mdisk2:0:0:68.4GB:tier0_flash:15000:1:1:no:512:0
2:mdisk2:1:17:68.4GB:tier0_flash:15000:1:2:no:512:0
2:mdisk2:2:1:68.4GB:tier0_flash:15000:14:1:no:512:2
2:mdisk2:3:18:68.4GB:tier0_flash:15000:14:2:no:512:2
```

An invocation example

```
lsarraymembergoals -filtervalue block_size_goal=4096
```

The resulting output:

```
mdisk_id mdisk_name member_id drive_id capacity_goal tech_type_goal RPM_goal enclosure_id_goal slot_id_goal node_id_goal
enclosure_balance_goal block_size_goal drive_class_id_goal
4 no r10_array 0 4096 0 43 1.6TB tier0_flash 10000 1 21
4 no r10_array 1 4096 0 44 1.6TB tier0_flash 10000 1 18
4 no r10_array 2 4096 0 45 1.6TB tier0_flash 10000 1 20
4 no r10_array 3 4096 2 46 1.6TB tier0_flash 10000 2 5
```

```
lsarraymembergoals
```

The resulting output:

```
mdisk_id mdisk_name member_id drive_id capacity_goal tech_type_goal RPM_goal enclosure_id_goal slot_id_goal
node_id_goal enclosure_balance_goal block_size_goal drive_class_id_goal

rmarry

Use the **rmarry** command to remove an array MDisk from the configuration.

lsarraymemberprogress

Use the **lsarraymemberprogress** command to display array member background process status.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-filtervalue attribute=value

(Optional) Specifies a list of one or more filters. Only objects with a value that matches the filter attribute value are displayed.

Note: Some filters allow the use of a wildcard when you enter the command. The following rules apply to the use of wildcards:

- The wildcard character is the asterisk (*).
- The command can contain a maximum of one wildcard.
- When you use a wildcard, enclose the filter entry within double quotation marks (""):
`lsarraymemberprogress -filtervalue mdisk_id="1*"`

-filtervalue?

(Optional) Displays the valid filter attributes for the **-filtervalue** parameter:

- estimated_completion_time
- drive_id

- mdisk_id
- mdisk_name
- member_id
- new_drive_id
- progress
- task

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

mdisk_id

(Optional) The identity of the array MDisk.

mdisk_name

(Optional) The MDisk name that you provided.

Description

This command displays array member background process status. Exchange cannot start on a rebuilding member because both component rebuild and exchange are shown in the same view. This table provides the potential output for this command.

<i>Table 20. lsarraymemberprogress output</i>	
Attribute	Value
member_id	Indicates the array member index.
drive_id	Indicates the ID of the drive.
task	<p>Indicates the identity of task that is being performed by the array member:</p> <ul style="list-style-type: none"> • rebuild indicates that the array is recovering all the data on the component (after it was removed) • exchange indicates that the component is copying data to another drive • resync indicates that this member is unsynchronized and is performing write operations that were completed early • copyback indicates that this member is copying data to an array member that recently became active. <p>Note: This value applies to distributed arrays.</p> <p>Note: For example, if the drive fails the array is rebuilt. If the drive does not fail or is replaced, a copyback occurs to write data back to the array member.</p>
new_drive_id	The identity of drive that is being exchanged.
progress	Indicates the task percentage completion.

Table 20. *lsarraymemberprogress* output (continued)

Attribute	Value
estimated_completion_time	Indicates the expected task completion time in the format YYMMDDHHMMSS. It is blank if completion time is unknown.

A concise invocation example

```
lsarraymemberprogress -delim :
```

The resulting output:

```
mdisk_id:mdisk_name:member_id:drive_id:task:new_drive_id:progress:estimated_completion_time
0:mdisk0:2:3:rebuild::50:070301120000
1:mdisk1:0:5:rebuild::51:070301130000
2:mdisk2:4:1:exchange:12:32:070301153500
2:mdisk2:5:16:exchange:13:0:
2:mdisk2:5:17:exchange:14:0:
```

An MDisk qualified concise example

```
lsarraymemberprogress mdisk_2
```

The resulting output:

```
mdisk_id:mdisk_name:member_id:drive_id:task:new_drive_id:progress:estimated_completion_time
2:mdisk2:4:1:exchange:12:32:070301153500
2:mdisk2:5:16:exchange:13:0:
2:mdisk2:5:17:exchange:14:0:
```

An invocation example

```
lsarraymemberprogress
```

The resulting output:

```
mdisk_id mdisk_name member_id drive_id task new_drive_id progress estimated_completion_time
3 mdisk3 5 1 resync 95 121203193637
3 mdisk3 6 2 rebuild 0 121203234321
3 mdisk3 7 3 exchange 18 0 121204033229
```

An invocation example

```
lsarraymemberprogress
```

The resulting output:

```
mdisk_id mdisk_name member_id drive_id task new_drive_id progress estimated_completion_time
3 mdisk3 4 7 copyback 10 150710165446
```

[charray](#)

Use the **charray** command to change array attributes.

[charraymember](#)

Use the **charraymember** command to modify an array member's attributes, or to swap (exchange) a member of a RAID array with that of another drive.

[expandarray](#)

Use the **expandarray** command to add new drive capacity to an existing distributed array MDisk.

lsarray

Use the **lsarray** command to list the array MDisk.

lsarrayexpansionprogress

Use the **lsarrayexpansionprogress** command to display the array expansion task status for one or more arrays.

lsarrayinitprogress

Use the **lsarrayinitprogress** command to view the progress of array background initialization that occurs after creation.

lsarraylba

Use the **lsarraylba** command to permit an array logical block addressing (LBA) to be found from a drive and LBA.

lsarraymember

Use the **lsarraymember** command to list the member drives of one or more array MDisk.

lsarraymembergoals

Use the **lsarraymembergoals** command to list the spare goals for member drives of one or more array MDisk.

lsarrayrecommendation

Use the **lsarrayrecommendation** command to view a recommended configuration for the specified drive class and number of drives.

lsarraysyncprogress

Use the **lsarraysyncprogress** command to display how synchronized a RAID array is.

lscompatibledriveclasses

Use the **lscompatibledriveclasses** command to display all compatible drive class IDs for a given existing drive class.

lspotentialarraysize

Use the **lspotentialarraysize** command to display the size of a potential array for a specified drive count, drive class, and RAID level in the specified MDisk group.

mkarray

Use the **mkarray** command to create an MDisk array and add it to a storage pool. This command applies to nondistributed arrays. (Use the **mkdistributedarray** command to create distributed arrays).

mkdistributedarray

Use the **mkdistributedarray** command to create a distributed array and add it to a storage pool. (Use the **mkarray** command to create nondistributed arrays).

recoverarray

Use the **recoverarray** command to recover a specific corrupted array when you recover from either a T3 or when both nodes in an I/O group are removed.

recoverarraybycluster (Discontinued)

Attention: The **recoverarraybycluster** command has been discontinued. Use the **recoverarraybysystem** command instead.

recoverarraybysystem

Use the **recoverarraybysystem** command to recover corrupted arrays from either a T3 or when both nodes in an I/O group are removed.

rmarray

Use the **rmarray** command to remove an array MDisk from the configuration.

lsarrayrecommendation

Use the **lsarrayrecommendation** command to view a recommended configuration for the specified drive class and number of drives.

Syntax

►► lsarrayrecommendation — -driveclass — *drive class id list* — -drivecount →

Parameters

-driveclass *drive class id list*

(Required) Specifies the drive class, or classes, for which the array recommendation is made. You must specify at least 1 *drive_class_id_list* value. You can specify a total of 32 *drive_class_id_list* values on a single command; however, you must separate each value with a colon character (:).

-drivecount *drive count list*

(Required) Specifies the number of drives for which to make recommendation. You must specify at least 1 *drive_count* value. You can specify a total of 32 *drive_count* values on a single command; however, you must separate each value with a colon character (:).

Remember: Each `drive_count` value must be a numerical value between 2 and 128 (only redundant arrays are considered).

-nohdx

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-filtervalue *attribute=value*

(Optional) Specifies a list of one or more filter attributes that match the specified values; see **-filtervalue?** for the supported attributes.

Note: Some filters allow the use of a wildcard; the following rules apply when using a wildcard character:

- The wildcard character is an asterisk (*).
- The command can contain a maximum of one wildcard, which must be the first or last character in the string.
- You must enclose the filter entry within double quotation marks (" ").

-filtervalue?

(Optional) Includes all of the valid filter attributes in the report. The following filter attributes are valid for the **lsarrayrecommendation** command:

- raid_level
- distributed

Any parameters that are specified with the **-filtervalue?** parameter are ignored.

-delim delimiter

(Optional) By default, in a concise view all columns of data are space-separated, with the width of each column set to the maximum width of each item of data. In a detailed view, each item of data is an individual row, and if you display headers, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. Enter **-delim :** on the command line. The colon character (:) separates all items of data in a concise view (for example, the spacing of columns does not occur). In a detailed view, the specified *delimiter* separates the data from its header.

mdiskgrp_id

mdiskgrp_name

(Required) The ID or name of the pool for which to make the recommendation.

Description

This command displays the system-recommended array configuration for a specific drive class and number of drives.

Encrypted pools can be recommended or used if the specified storage pool is encrypted.

This table provides the attribute values that can be displayed as output view data.

Table 21. <i>lsarrayrecommendation</i> output	
Attribute	Possible Values
mdiskgrp_id	Indicates the MDisk group ID
mdiskgrp_name	Indicates the MDisk group name
drive_class_id	Indicates the drive class ID for the recommendation.
raid_level	Indicates the recommended RAID level.
distributed	Indicates whether the array is a distributed array recommendation.
min_stripe_width	Indicates the stripe width minimum.
max_stripe_width	Indicates the stripe width maximum.
stripe_width	Indicates the recommended stripe size for this storage pool.
rebuild_areas	Indicates the recommended number of rebuild areas.
strip_size	Indicates the recommended strip size for this storage pool.
drive_count	Indicates the number of drives to configure per array.
array_count	Indicates the number of arrays that can be created at the recommended drive count.
capacity	Indicates the expected usable capacity for virtualization for the array or arrays.

Note: The default recommendation for each drive class is the first row that is listed in the output for that drive class. All other rows for each drive class are not sorted by order of recommendation.

An invocation example

Making a recommendation for more rebuild areas and larger stripe width because there are other existing arrays in the MDisk group:

```
lsarrayrecommendation -driveclass 2 -drivecount 60 dist_pool
```

The detailed resulting output:

mdisk_grp_id	mdisk_grp_name	drive_class_id	raid_level	distributed	min_stripe_width	max_stripe_width	stripe_width	rebuild_areas	strip_size	drive_count	array_count	capacity
0	dist_pool	2	raid6	yes	5	16						
12	3	256	60	1	255.2TB							

An invocation example

Making a recommendation for a new (empty) storage pool and with a row for each raid level:

```
lsarrayrecommendation -driveclass 2 -drivecount 80 mdiskgrp0
```

The detailed resulting output:

mdisk_grp_id	mdisk_grp_name	drive_class_id	raid_level	distributed	min_stripe_width	max_stripe_width	stripe_width	rebuild_areas	strip_size	drive_count	array_count	capacity
0	mdiskgrp0	2	raid5	yes	3	16	6	2	256	40		
2	410.1TB											
0	mdiskgrp0	2	raid6	yes	5	16	12	3	256	40		
2	400.1TB											
0	mdiskgrp0	2	raid5	yes	2	16	8	2	256	40		
2	380.1TB											
0	mdiskgrp0	2	raid1	no	2	16	2		256	10		
8	410.1TB											
0	mdiskgrp0	2	raid5	no	3	16	10		256	10		
7	410.1TB											
0	mdiskgrp0	2	raid6	no	5	16	10		256	10		
7	400.1TB											
0	mdiskgrp0	2	raid5	no	2	16	8		256	8		
9	380.1TB											

An invocation example

Making a recommendation for multiple drive classes for a new (empty) storage pool:

```
lsarrayrecommendation -driveclass 3:5 -drivecount 80:24 mdiskgrp0
```

The detailed resulting output:

mdisk_grp_id	mdisk_grp_name	drive_class_id	raid_level	distributed	min_stripe_width	max_stripe_width	stripe_width	rebuild_areas	strip_size	drive_count	array_count	capacity
0	mdiskgrp0	3	raid5	yes	3	16	6	2	256	40		
2	500.4TB											
0	mdiskgrp0	3	raid6	yes	5	16	12	3	256	40		
2	480.4TB											
0	mdiskgrp0	3	raid5	yes	2	16	8	2	256	40		
2	450.4TB											
0	mdiskgrp0	3	raid1	no	2	16	2		256	10		
8	400.6TB											
0	mdiskgrp0	3	raid5	no	3	16	10		256	10		
7	500.6TB											
0	mdiskgrp0	3	raid6	no	5	16	10		256	10		
7	480.6TB											
0	mdiskgrp0	3	raid5	no	2	16	8		256	8		
9	450.6TB											
0	mdiskgrp0	5	raid5	yes	3	16	6	2	256	12		
2	200.7TB											
0	mdiskgrp0	5	raid6	yes	5	16	12	3	256	12		
2	180.7TB											
0	mdiskgrp0	5	raid5	yes	2	16	8	2	256	8		
3	150.7TB											
0	mdiskgrp0	5	raid1	no	2	16	2		256	8		
3	100.2TB											
0	mdiskgrp0	5	raid5	no	3	16	12		256	12		
2	200.2TB											
0	mdiskgrp0	5	raid6	no	5	16	12		256	12		
2	180.2TB											
0	mdiskgrp0	5	raid5	no	2	16	8		256	8		
3	150.2TB

recoverarray

Use the **recoverarray** command to recover a specific corrupted array when you recover from either a T3 or when both nodes in an I/O group are removed.

recoverarraybycluster (Discontinued)

Attention: The **recoverarraybycluster** command has been discontinued. Use the **recoverarraybysystem** command instead.

recoverarraybysystem

Use the **recoverarraybysystem** command to recover corrupted arrays from either a T3 or when both nodes in an I/O group are removed.

rmarray

Use the **rmarray** command to remove an array MDisk from the configuration.

lsarraysyncprogress

Use the **lsarraysyncprogress** command to display how synchronized a RAID array is.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-filtervalue attribute=value

(Optional) Specifies a list of one or more filters. Only objects with a value that matches the filter attribute value are displayed.

Note: Some filters allow the use of a wildcard when you enter the command. The following rules apply to the use of wildcards:

- The wildcard character is the asterisk (*).
- The command can contain a maximum of one wildcard.
- When you use a wildcard, enclose the filter entry within double quotation marks (""):
`lsarraysyncprogress -filtervalue mdisk_id="1*"`

-filtervalue?

(Optional) Displays the valid filter attributes for the **-filtervalue** parameter:

- estimated_completion_time
- mdisk_id
- mdisk_name
- progress

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

mdisk_id

(Optional) The ID of the MDisk you want to view.

mdisk_name

(Optional) The user-defined name of the MDisk you want to view.

Description

This command shows you how synchronized a RAID array is. It includes internal activity that is working toward a fully synchronized array. This table provides the potential output.

Table 22. <i>lsarraysyncprogress</i> output	
Attribute	Value
progress	The percentage of the array that is synchronized.
estimated_completion_time	The expected synchronization completion time (YYMMDDHHMMSS; blank if completion time unknown).

A concise invocation example

```
lsarraysyncprogress -delim :
```

The resulting output:

```
mdisk_id:mdisk_name:progress:estimated_completion_time
0:mdisk0:50:070301120000
1:mdisk1:51:070301130000
2:mdisk2:32:070301153500
```

A concise view (qualified with mdisk id for mdisk2) invocation example

```
lsarraysyncprogress -delim : mdisk2
```

The resulting output:

```
mdisk_id:mdisk_name:progress:estimated_completion_time
2:mdisk2:32:070301153500
```

A concise view (qualified with mdisk id for in sync mdisk10) invocation example

```
lsarraysyncprogress -delim : mdisk_10
```

The resulting output:

```
mdisk_id:mdisk_name:progress:estimated_completion_time
0:mdisk10:100:
```

Use the **rmarray** command to remove an array MDisk from the configuration.

lscompatibledriveclasses

Use the **lscompatibledriveclasses** command to display all compatible drive class IDs for a given existing drive class.

Syntax

➤ **lscompatibledriveclasses**  **-driveclass_id** ➤

Parameters

-nohdr

(Optional) By default, headings are displayed for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. In a detailed view, the data is separated from its header by the specified delimiter.

driveclass_id

(Optional) The identity of the drive class.

Description

This command lists the IDs of the drive classes that are compatible with the given drive class. This information is used in conjunction with the **lsdriveclass** command to ascertain additional details. This table provides the attribute values that can be displayed as output view data.

Table 23. Output	
Attribute	Values
id	Indicates the drive class IDs that are compatible with the specified ID.

An invocation example that shows all compatible drive classes for drive class ID 0. For example, suppose drive classes 3 and 4 are superior to drive class 0.

```
svcinfo lscompatibledriveclasses 0
```

The resulting output:

```
id
0
3
4
```

lspotentialarraysize

Use the **lspotentialarraysize** command to display the size of a potential array for a specified drive count, drive class, and RAID level in the specified MDisk group.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim *delimiter*

(Optional) By default, in a concise view all columns of data are space-separated, with the width of each column set to the maximum width of each item of data. In a detailed view, each item of data is an individual row, and if you display headers, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. Enter **-delim :** on the command line; the colon character (:) separates all items of data in a concise view (for example, the spacing of columns does not occur). In a detailed view, the specified *delimiter* separates the data from its header.

-drivecount 3 - 128

(Required) Specifies the number of the drives. The value must be a number from 3 - 128.

-driveclass *drive_class_id*

(Required) Specifies the drive class. The *driveclass_id* value must be a number.

-level *raid1* / *raid5* / *raid6* / *raid10*

(Required) Specifies one of the following RAID levels for the array that is being created. The values are:

- *raid1*
- *raid5*
- *raid6*

- *raid10*

-stripewidth 2 - 16

(Required) Indicates the width of a single unit of redundancy within a distributed set of drives. The value must be:

- RAID-1: 2 - 16
- RAID-5: 3 - 16
- RAID-6: 5 - 16
- RAID-10: 2, 4, 6, 8, 10, 12, 14, 16 (You cannot use RAID-10 with distributed arrays.)

-rebuildareas 1 / 2 / 3 / 4

(Optional) Specifies the number of rebuild areas in the array. This value must be 1 - 4 (inclusive) for RAID-5 and RAID-6 arrays.

Note: This parameter is only applicable for distributed arrays.

-strip 128 / 256

(Optional) Specifies sets the strip size in KiB for the array that is being configured. The values are 128 or 256.

mdiskgrp_id / mdiskgrp_name

(Required) Indicates the MDisk array ID or name.

Description

This command displays the size of a potential array for a specified drive count, class, and RAID level.

You can use this command to define potential sizes for nondistributed and distributed arrays. (Distributed array descriptions are triggered by using **-rebuildareas**.) This command assists with the configuration options that are provided during array creation, and estimates the array capacity if it were to be configured

This table provides the attribute values that can be displayed as output view data.

<i>Table 24. lspotentialarraysize output</i>	
Attribute	Possible Values
capacity	Indicates the expected usable capacity for virtualization for the array or arrays.

An invocation example that uses a small drive count for a distributed array

```
lspotentialarraysize -driveclass 4 -drivecount 40 -level raid5 -stripewidth 6 -rebuildareas 2
mdiskgrp1
```

The detailed resulting output:

```
capacity
115.2TB
```

An invocation example that uses a different class and fewer rebuild areas

```
lspotentialarraysize -driveclass 4 -drivecount 100 -level raid5 -stripewidth 8 -strip 128 -
rebuildareas 1 mdiskgrp1
```

The detailed resulting output:

```
capacity
172.4TB
```

An invocation example that uses the same class and no rebuild areas

```
lspotentialarraysize -driveclass 4 -drivecount 100 -level raid5 -stripewidth 8 -strip 128 1
```

The detailed resulting output:

```
capacity
184.3TB
```

Use the **recoverarraybysystem** command to recover corrupted arrays from either a T3 or when both nodes in an I/O group are removed.

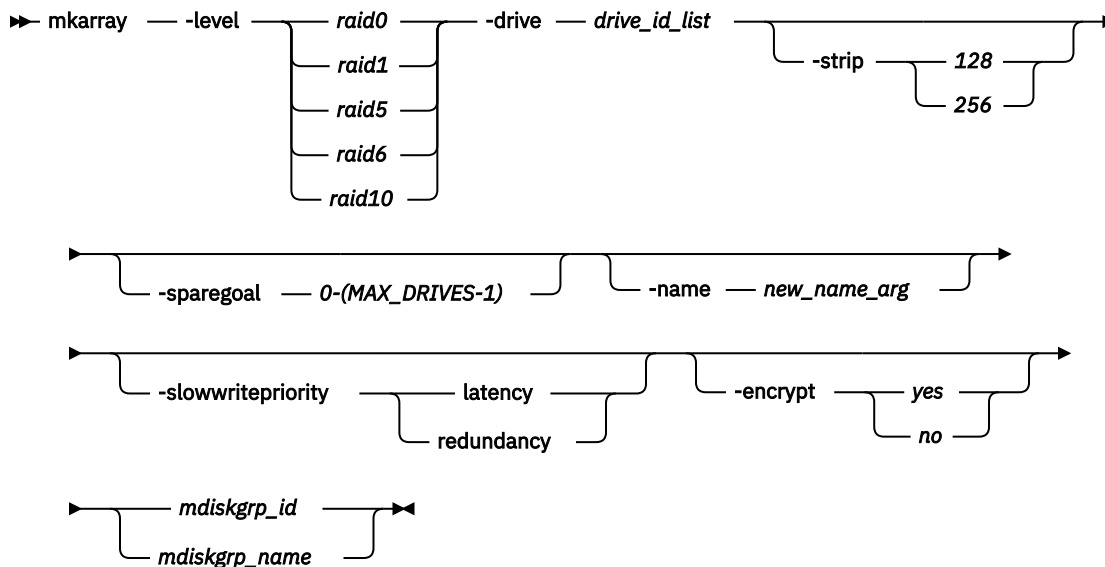

[rmarray](#)

Use the **rmarray** command to remove an array MDisk from the configuration.

mkarray

Use the **mkarray** command to create an MDisk array and add it to a storage pool. This command applies to nondistributed arrays. (Use the **mkdistributedarray** command to create distributed arrays).

Syntax

Parameters

-level

(Required) Sets the RAID level for the array MDisk being created.

The following requirements apply for RAID levels:

- RAID-0: Stripes data across all members, provides no redundancy.
- RAID-1: Mirrored pair of drives, allows reading from either drive. Can tolerate either drive failing.
- RAID-5: These arrays stripe data over the member drives with one parity strip on every stripe and can tolerate no more than one member drive failure.
- RAID-6: These arrays stripe data over the member drives with two parity strips on every stripe and can tolerate any two concurrent member drive failures.
- RAID-10: These arrays are in a set of up to eight mirrored pairs with the data striped across mirrors. They can tolerate the failure of one drive in each mirror and they allow reading from both drives in a mirror. (You cannot use RAID-10 with distributed arrays).

Restriction: RAID-5 and RAID-6 are for enclosure-based systems only.

-drive *drive_id_list*

(Optional) Identifies the drive or drives to use as members of the RAID array.

For RAID-1 and RAID-10 arrays, drives are specified as a sequence of mirrored drive pairs. For example, if an array is created with `-drive a:b:c:d`, drive *b* contains the mirror copy of drive *a*, and drive *d* contains the mirror copy of drive *c*. (You cannot use RAID-10 with distributed arrays).

This list shows how many member drives are allowed in each supported RAID type:

- RAID-0: Allows one-member to eight-member drives.

Note: Internal drives must be in the same node.

- RAID-1: Allows two-member drives.
- RAID-5, which is for enclosure-based systems only: Allows three-member to 16-member drives.
- RAID-6, which is for enclosure-based systems only: Allows five-member to 16-member drives.
- RAID-10: Allows drives with:
 - Two members
 - Four members
 - Six members
 - Eight members
 - Ten members
 - Twelve members
 - Fourteen members
 - Sixteen members

Each pair of drives must contain a drive from a node in the I/O group and a drive from the other node. (You cannot use RAID-10 with distributed arrays.)

-strip *128 / 256*

(Optional) Sets strip size (in KB) for the array MDisk being created. The default is 256 KB.

-sparegoal *0-(MAX_DRIVES-1)*

(Optional) Sets the number of spares that this array's members must be protected by. The default is 1 (except for RAID-0 arrays, which have a default of 0).

-name *new_name_arg*

(Optional) Specifies the name to which you want to apply the array MDisk.

-slowwritepriority *latency | redundancy*

(Optional) Controls the array ability to complete write operations that take too long, even if it temporarily compromises redundancy.

The value can be either *latency* or *redundancy*:

- *latency* implies that the feature is enabled for normal I/O operations
- *redundancy* implies that the feature is not enabled for normal I/O operations

The default value is *latency* mode for existing arrays, unless the array is RAID-0 (in which case *redundancy* mode is required).

Important: Do not change the mode of a RAID-0 array.

-encrypt *yes / no*

(Optional) Specifies whether the new array is encrypted or not. The values are *yes* and *no*.

This parameter defaults to *yes* when **lsencryption** has its **status** or **keyserver_status** set to enabled and all nodes in the I/O group that the array is being defined on are encryption-capable.

Note: The value can be *yes* only if encryption is enabled on the array's I/O group.

mdiskgrp_id / mdiskgrp_name

(Required) Identifies the storage pool (by name or ID) to which you want to add the created array MDisk.

Description

This command creates an array MDisk RAID array and adds it to a storage pool. Although the array tier is automatically determined, you can change it later using the **chmdisk** command.

An array MDisk being added to a storage pool that is used for active-active relationships must match other MDisks in the storage pool.

Remember: This command cannot be used to add an array to a child pool.

If the `raid_level` is RAID-1 or RAID-10, and the drive list contains drives that do not share a SAS port connection chain, the array attempts to continue to maintain the location balance between the mirrored pairs. (You cannot use RAID-10 with distributed arrays.) Configuration changes indicate that a member drive might not be goal-balanced depending on its current chain. This is relative to both the drive that created the array member goals and the current chain of the mirror partner.

If the MDisk group has an encryption key, the array must be encrypted.

An invocation example (to create arrays)

```
mkarray -level raid0 -drive 0:1:2:3 raid0grp
```

The resulting output:

```
MDisk, id [0], successfully created
```

An invocation example (to create fully redundant arrays)

```
mkarray -level raid1 -drive 4:5 -strip 128 mdiskgrp_4
```

The resulting output:

```
MDisk, id [1], successfully created
```

An invocation example for creating an unencrypted array on encrypted hardware

```
mkarray -level raid10 -drives 0:1:2:3:4:5 -encrypt no 0
```

The resulting output:

```
MDisk, id [1], successfully created
```

An invocation example showing error in technology or transport protocol type.

```
mkarray -drive 1:2 -level raid1 0
```

The resulting output:

```
CMMVC9289E The command failed because the drives selected have an incompatible combination of technology type and transport protocol.
```

Related reference

[charray](#)

Use the **charray** command to change array attributes.

[charraymember](#)

Use the **charraymember** command to modify an array member's attributes, or to swap (exchange) a member of a RAID array with that of another drive.

expandarray

Use the **expandarray** command to add new drive capacity to an existing distributed array MDisk.

lsarray

Use the **lsarray** command to list the array MDisks.

lsarrayexpansionprogress

Use the **lsarrayexpansionprogress** command to display the array expansion task status for one or more arrays.

lsarrayinitprogress

Use the **lsarrayinitprogress** command to view the progress of array background initialization that occurs after creation.

lsarraylba

Use the **lsarraylba** command to permit an array logical block addressing (LBA) to be found from a drive and LBA.

lsarraymember

Use the **lsarraymember** command to list the member drives of one or more array MDisks.

lsarraymembergoals

Use the **lsarraymembergoals** command to list the spare goals for member drives of one or more array MDisks.

lsarraymemberprogress

Use the **lsarraymemberprogress** command to display array member background process status.

lsarrayrecommendation

Use the **lsarrayrecommendation** command to view a recommended configuration for the specified drive class and number of drives.

lsarraysyncprogress

Use the **lsarraysyncprogress** command to display how synchronized a RAID array is.

lscompatibledriveclasses

Use the **lscompatibledriveclasses** command to display all compatible drive class IDs for a given existing drive class.

lspotentialarraysize

Use the **lspotentialarraysize** command to display the size of a potential array for a specified drive count, drive class, and RAID level in the specified MDisk group.

mkdistributedarray

Use the **mkdistributedarray** command to create a distributed array and add it to a storage pool. (Use the **mkarray** command to create nondistributed arrays).

recoverarray

Use the **recoverarray** command to recover a specific corrupted array when you recover from either a T3 or when both nodes in an I/O group are removed.

recoverarraybycluster (Discontinued)

Attention: The **recoverarraybycluster** command has been discontinued. Use the **recoverarraybysystem** command instead.

recoverarraybysystem

Use the **recoverarraybysystem** command to recover corrupted arrays from either a T3 or when both nodes in an I/O group are removed.

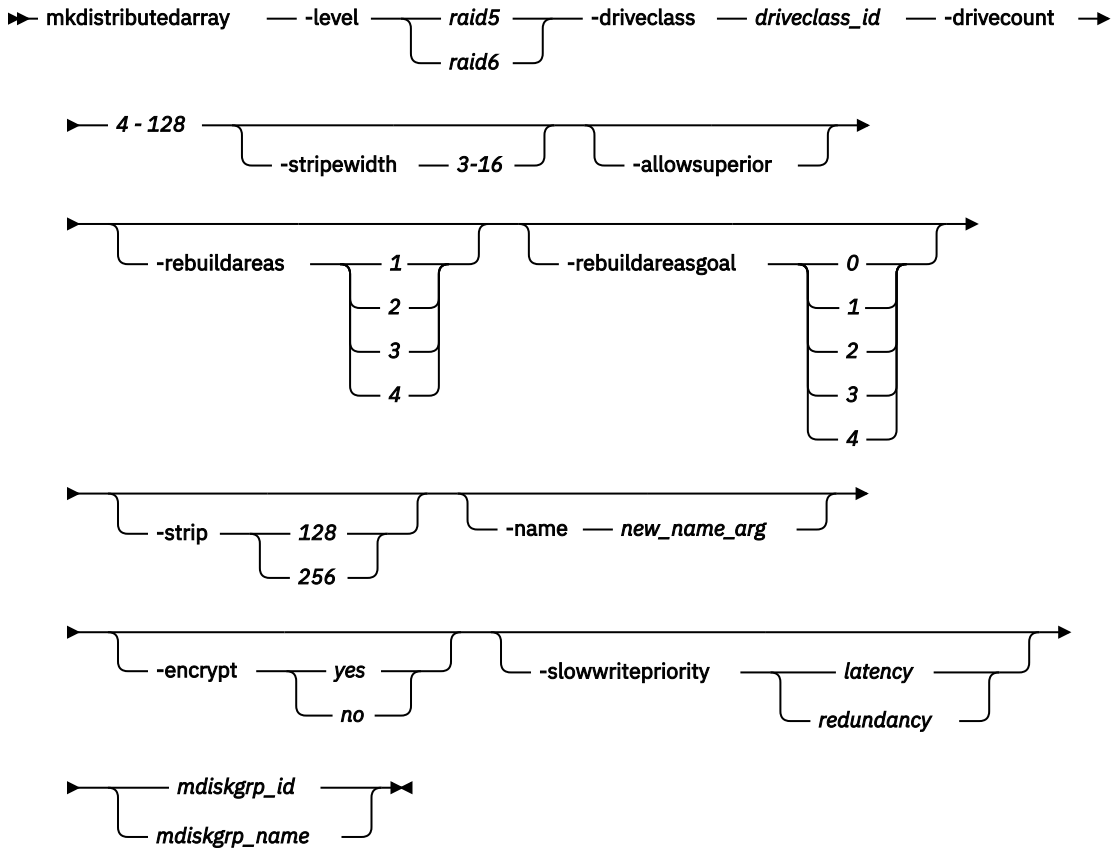

rmarray

Use the **rmarray** command to remove an array MDisk from the configuration.

mkdistributedarray

Use the **mkdistributedarray** command to create a distributed array and add it to a storage pool. (Use the **mkarray** command to create nondistributed arrays).

Syntax

Parameters

-level *raid5* / *raid6*

(Required) Specifies the RAID level for the array that is being created. The values are:

- *raid5*
- *raid6*

-driveclass *driveclass_id*

(Required) Specifies the class that is being used to create the array. The *driveclass_id* must be a numeric value (specified with the **lsdriveclass** command).

-drivecount *4 - 128*

(Required) Specifies the number of drives to use for the array. The minimum drive count for:

- RAID-5: 4
- RAID-6: 6

-stripewidth *3-16*

(Optional) Indicates the width of a single unit of redundancy within a distributed set of drives. The value must be:

- RAID-5: 3 - 16

- RAID-6: 5 - 16

The default width for RAID-6 is 12 and the default width for RAID-5 is 9. The width plus the number of rebuild areas must be less than or equal to the drive count.

-allowsuperior

(Optional) Specifies that you can use drives that are not an exact match to the drive class used when creating the array (such as drives that use different capacity or technology). The system attempts to select the closest match to the class when satisfying the drive count. You can select higher capacity members of the same technology type before you select higher technology members.

Note: For a drive A to be considered superior to drive B, these situations must be true:

1. Drives A and B are use=candidate
2. Drives A and B are in the same I/O group.
3. Drive A's speed is equal to or greater than drive B's. Solid-state drives (SSDs) are higher speed than all hard disk drives (HDDs). For SSDs, **tech_type tier0_flash** is considered to have better performance than *tier1_flash*.
4. Drive A's capacity is equal to or greater than drive B's.
5. Drive A has a block size that is smaller than or equal to drive B.
6. Drives A and B have the same transport protocol.
7. Drives A and B are both not compressing drives or Drives A and B are both compressing drives of the same physical capacity and logical capacity.

-rebuildareas 1 / 2 / 3 / 4

(Optional) Specifies the **overhead capacity** that is distributed across all drives available to an array. This capacity restores data after a drive failure. The values are:

- 1
- 2
- 3
- 4

The value is 1 - 4 (inclusive) for RAID-5 and RAID-6 arrays.

The default number of rebuild areas increases as the drive count increases.

Note: The number of rebuild areas plus the stripe width must be less than or equal to the total drive count.

-rebuildareasgoal 0 / 1 / 2 / 3 / 4

(Optional) Specifies the number of rebuild areas that the array can target to keep available. If the number available in the array falls below this number, a system alert is raised.

Note: The goal value should not exceed the number of rebuild areas that are specified for the array.

The values are:

- 0
- 1
- 2
- 3
- 4

-strip 128 / 256

(Optional) Specifies the strip size in KiB for the array that is being configured. The values are 128 or 256.

Note: This command fails if 128 is specified and the size of the candidate drives is greater than 4 TB.

-name *new_name_arg*

(Optional) Specifies the name of the array.

-encrypt *yes / no*

(Optional) Specifies the array to encrypt. The values are yes and no. This parameter defaults to yes when **lsencryption** has its status set to enabled and all nodes in the I/O group that the array is being defined on are encryption-capable.

Note: The value can be yes only if encryption is enabled on the array's I/O group.

If you specify -encrypt yes when the I/O group does not support encryption, the command fails.

-slowwritepriority *latency | redundancy*

(Optional) Controls array ability to complete write operations that take too long, even if it temporarily compromises redundancy.

The value can be either latency or redundancy:

- latency implies that the feature is enabled for normal I/O operations
- redundancy implies that the feature is not enabled for normal I/O operations

The default value is latency mode for existing arrays).

Important: An array can cause member drives to become unsynchronized (to preserve response time) if the value is latency. If the value is redundancy, the array cannot cause member drives to become unsynchronized (to preserve time) and I/O performance is impacted.

mdiskgrp_id | mdiskgrp_name

(Required) Indicates the MDisk array ID or name.

Description

This command creates distributed arrays.

Remember: You cannot create an unencrypted array to add to an encrypted storage pool.

Each distributed array occupies 16 slots, which start at an MDisk ID that is divisible by 16. See the **lsmdisk** command for more information.

An invocation example to create an array that uses 40 drives of class 3 with 3 rebuild areas

```
mkdistributedarray -level raid6 -driveclass 3 -drivecount 40 -stripewidth 10 -rebuildareas 3
mdiskgrp5
```

The detailed resulting output:

```
MDisk, id [16], successfully created
```

An invocation example to create an array with a drive class

```
mkdistributedarray -level raid5 -driveclass 0 -drivecount 56 -stripewidth 8 -allowsuperior
mdiskgrp2
```

The detailed resulting output:

```
MDisk, id [32], successfully created
```

An invocation example to create an array with maximum rebuild areas that logs an error on using the second rebuild area

```
mkdistributedarray -level raid5 -driveclass 5 -drivecount 60 -rebuildareas 4 -rebuildareasgoal
3 mdiskgrp2
```

The detailed resulting output:

```
MDisk, id [16], successfully created
```

An invocation example to create an array that might affect I/O performance

```
mkdistributedarray -driveclass 10 -slowwritepriority redundancy 0
```

The detailed resulting output:

```
MDisk, id [32], successfully created
```

An invocation example to make an encrypted distributed array that uses 40 drives of class 3 with three rebuild areas

```
mkdistributedarray -level raid6 -driveclass 3 -drivecount 40 -stripewidth 10 -rebuildareas 3 -  
encrypt yes mdiskgrp5
```

The detailed resulting output:

```
MDisk, id [16], successfully created
```

Attention: The **recoverarraybycluster** command has been discontinued. Use the **recoverarraybysystem** command instead.

recoverarraybysystem

Use the **recoverarraybysystem** command to recover corrupted arrays from either a T3 or when both nodes in an I/O group are removed.

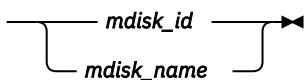

rmarray

Use the **rmarray** command to remove an array MDisk from the configuration.

recoverarray

Use the **recoverarray** command to recover a specific corrupted array when you recover from either a T3 or when both nodes in an I/O group are removed.

Syntax

► `recoverarray` 

Parameters

mdisk_id

(Optional) Identifies (by ID) the specific array to recover.

mdisk_name

(Optional) Identifies (by user-assigned name) the specific array to recover.

Description

This command recovers a specific corrupt array. An array has metadata representing ongoing or pending product writes, which are lost when the domain nodes are lost.

It is not necessary to run this command when both nodes go offline and return to an online state.

An invocation example

```
recoverarray mdisk_1
```

The resulting output:

```
There is no output if the command is successful.
```

recoverarraybycluster (Discontinued)

Attention: The **recoverarraybycluster** command has been discontinued. Use the **recoverarraybysystem** command instead.

rmarray

Use the **rmarray** command to remove an array MDisk from the configuration.

rmarray

Use the **rmarray** command to remove an array MDisk from the configuration.

Syntax

```
► rmarray — -mdisk mdisk_id_list mdiskgrp_id ►
                mdisk_name_list -force mdiskgrp_name
```

Parameters

-mdisk *mdisk_id_list* | *mdisk_name_list*

(Required) Identifies the array MDisk or a colon-delimited list of MDisks to remove from the storage pool.

-force

(Optional) Forces a removal when the MDisk has allocated extents by migrating the used extents to free extents in the storage pool.

-enclosure *enclosure_id*

(Required) Specifies the enclosure that the array should be removed from.

mdiskgrp_id / mdiskgrp_name

(Required) Identifies (by name or ID) the storage pool to remove the created array MDisk from.

Description

This command removes an array MDisk from the configuration. Each array is divided into candidate drives.

Remember: This command cannot be used to remove an array MDisk from a child pool.

Note: If **rmarray** is used to remove an array that contains compressed member drives, it causes all compressed drive members to perform a format. The format must complete before the drives come online as candidates available for use.

An invocation example

```
rmarray -mdisk 6 mdiskgrp_10
```

The resulting output:

```
No feedback
```

recoverarraybysystem

Use the **recoverarraybysystem** command to recover corrupted arrays from either a T3 or when both nodes in an I/O group are removed.

Chapter 4. Audit log commands

Use the audit log commands to track command specifications and related data. An audit log keeps track of successful action commands that are issued through a Secure Shell (SSH) session or through the management GUI.

The audit log entries provide the following information:

- Identity of the user who issued the action command
- The name of the actionable command
- The timestamp of when the actionable command was issued on the configuration node
- The parameters which were issued with the actionable command

The following commands are not documented in the audit log:

- **dumpconfig**
- **cpdumps**
- **finderr**
- **dumperlog**

The following items are also not documented in the audit log:

- Commands that fail are not logged
- A result code of 0 (success) or 1 (success in progress) is not logged
- Result object ID of node type (for the **addnode** command) is not logged
- Views are not logged

catauditlog

Use the **catauditlog** command to display the in-memory contents of the audit log.

Syntax

➤ **catauditlog** -nohdr -delim *delimiter* -first *number_of_entries_to_return*

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a one-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

-first number_of_entries_to_return

(Optional) Specifies the number of most recent entries to display.

Description

This command lists a specified number of the most recently audited commands.

Use this command to display the in-memory audit log. Use the **dumppauditlog** command to manually dump the contents of the in-memory audit log to a file on the current configuration node and clear the contents of the in-memory audit log.

The in-memory portion of the audit log is limited to 500 entries.

Once the in-memory audit log reaches maximum capacity, the log is written to a local file on the configuration node in the `/dumps/audit` directory. The **catauditlog** command only displays the in-memory part of the audit log; the on-disk part of the audit log is in readable text format and does not require any special command to decode it.

The in-memory log entries are reset and cleared automatically, ready to accumulate new commands. The on-disk portion of the audit log can then be analyzed at a later date.

The **lsdumps** command with **-prefix** parameter (and the `/dumps/audit` file) can be used to list the files on the disk.

As commands are executed, they are recorded in the in-memory audit log. When the in-memory audit log becomes full, it is automatically dumped to an audit log file and the in-memory audit log is cleared.

An invocation example

This example lists the five most recent audit log entries.

```
catauditlog -delim : -first 5
```

The resulting output:

audit_seq_no	timestamp	cluster_user	challenge	source_panel	target_panel	ssh_ip_address
result	res_obj_id	action_cmd				
0	160313152255	superuser		7830619-2	7830619-2	
0	0	satask restartservice	-service tomcat			
1	160313152303	superuser		01-2	01-1	9.174.187.11
0	0	satask chnodeled	-on 01-1			
2	160313152312	superuser		01-1	01-2	9.174.187.11
0	0	satask chnodeled	-on 01-2

[dumppauditlog](#)

Use the **dumppauditlog** command to reset or clear the contents of the in-memory audit log. The contents of the audit log are sent to a file in the `/dumps/audit` directory on the current configuration node.

[Isauditlogdumps \(Deprecated\)](#)

The **lsauditlogdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

dumpauditlog

Use the **dumpauditlog** command to reset or clear the contents of the in-memory audit log. The contents of the audit log are sent to a file in the `/dumps/audit` directory on the current configuration node.

Syntax

➤ `dumpauditlog` ➤

Parameters

There are no parameters.

Description

This command dumps the contents of the audit log to a file on the current configuration node in a system. It also clears the contents of the audit log. This command is logged as the first entry in the new audit log.

Use this command to manually dump the contents of the in-memory audit log to a file on the current configuration node and clear the contents of the in-memory audit log. Use the **catauditlog** command to display the in-memory audit log.

Audit log dumps are automatically maintained in the `/dumps/audit` directory. The local file system space is used by audit log dumps and is limited to 200 MB on any node in the system. The space limit is maintained automatically by deleting the minimum number of old audit log dump files so that the `/dumps/audit` directory space is reduced below 200 MB. This deletion occurs once per day on every node in the system. The oldest audit log dump files are considered to be the ones with the lowest audit log sequence number. Also, audit log dump files with a system ID number that does not match the current one are considered to be older than files that match the system ID, regardless of sequence number.

Other than by running dumps (or copying dump files among nodes), you cannot alter the contents of the audit directory. Each dump file name is generated automatically in the following format:

```
auditlog_firstseq_lastseq_timestamp_clusterid
```

where

- *firstseq* is the audit log sequence number of the first entry in the log
- *lastseq* is the audit sequence number of the last entry in the log
- *timestamp* is the timestamp of the last entry in the audit log that is being dumped
- *clusterid* is the clustered system ID at the time that the dump was created
- *challenge* allows the `sra_privileged` user to determine who issued a particular command
- *source_panel* is the source panel ID in the audit log that is being dumped
- *target_panel* indicates the target panel ID in the audit log that is being dumped

The audit log dump files names cannot be changed.

The audit log entries in the dump files contain the same information as displayed by the **catauditlog** command; however, the **dumpauditlog** command displays the information with one field per line. The **lsdumps** command displays a list of the audit log dumps that are available on the nodes in the clustered system.

A sample audit log entry:

```
Auditlog Entry 0
Sequence Num    : 0
Timestamp       : Sun Mar 13 15:22:55 2016
```

```
Cluster User      : Epoch + 1457882575
Challenge         :
SSH IP Address    :
Result Code       : 0
Result Obj ID     : 0
Action Cmd        : satask restartservice -service tomcat
Source_Panel      : 7830619-2
Target_Panel      : 7830619-2
```

An invocation example

```
dumpauditlog
```

The resulting output:

```
No feedback
```

Chapter 5. Backup and restore commands

Use the backup and restore commands to back up and restore configuration information about the system.

svcconfig

Use the **svcconfig** command help option to obtain summary information about the syntax of the **svcconfig** command and actions. You can enter this command any time after a system is created.

Syntax

Parameters

backup

(Optional) Saves the current system configuration in the `/tmp` directory.

-quiet

(Optional) Suppresses standard output (STDOUT) messages from the console.

clear

(Optional) Erases the files in the `/tmp` directory.

-all

(Optional) Erases all configuration files.

-f | force

(Optional) Forces continued processing where possible.

-q | quiet

(Optional) Suppresses console output (STDOUT).

restore

(Optional) Checks the current configuration against the backup configuration in the /tmp directory.

-prepare -fmt / fmtdisk

(Optional) Verifies the current configuration against the information in `svc.config.backup.xml`; then prepares commands for processing in `svc.config.restore.sh`, and then produces a log of events in `svc.config.restore.prepare`.

-execute

(Optional) Runs the command script `svc.config.restore.sh`, and produces a log of events in `svc.config.restore.execute.log`.

-fmt

(Optional) Specifies that the volume should be formatted before use. Includes the **-fmt** option on all **mkvdisk** commands to be issued. You cannot specify **-fmt** with **-execute**.

-fmt

(Optional) Specifies that the volume should be formatted before use. You cannot specify **-fmt** with **-execute**.

-v on | off

Produces verbose output (on); the default is regular output (off).

-ver

(Required) Returns the version number for the **svconfig** command.

Description

This command provides syntax help for `svconfig`.

An invocation example

```
svconfig -ver  
svconfig -?  
svconfig backup
```

Related reference

[svconfig backup](#)

Use the **backup** command to back up the configuration. Enter this command any time after creating the system.

[svconfig clear](#)

Use the **clear** command to erase files in the /tmp directory that were previously produced by other **svconfig** commands. You can enter this command any time after a system has been created.

[svconfig cron](#)

Use the **cron** command to back up the configuration. Enter this command any time after creating the system.

[svconfig recover](#)

Use the **recover** command to recover the clustered system configuration in two phases, the preparation phase and the execution phase. This is a component of T3 Recovery.

[svconfig restore](#)

Use the **restore** command to restore the system to its previous configuration. This command uses the configuration files in the /tmp folder .

svconfig backup

Use the **backup** command to back up the configuration. Enter this command any time after creating the system.

Syntax

Parameters

-quiet

(Optional) Suppresses standard output (STDOUT) messages from the console.

-v on | off

(Optional) Displays normal (off, the default state) or verbose (on) command messages.

Description

The **backup** command extracts and stores configuration information from the system. The **backup** command produces the `svc.config.backup.xml`, `svc.config.backup.sh`, and `svc.config.backup.log` files, and saves them in the /tmp folder. The `.xml` file contains the extracted configuration information; the `.sh` file contains a script of the commands used to determine the configuration information; and the `.log` file contains details about command usage.

Note: If a previous `svc.config.backup.xml` file exists in the /tmp folder, it is archived as `svc.config.backup.bak`; only one archive file is stored in the /tmp folder.

The underscore character (_) prefix is reserved for backup and restore command usage; do not use the underscore character in any object names.

An invocation example

```
svconfig backup
```

The resulting output:

```
No feedback
```

Related reference

Use the **clear** command to erase files in the /tmp directory that were previously produced by other **svconfig** commands. You can enter this command any time after a system has been created.

[svconfig cron](#)

Use the **cron** command to back up the configuration. Enter this command any time after creating the system.

[svconfig recover](#)

Use the **recover** command to recover the clustered system configuration in two phases, the preparation phase and the execution phase. This is a component of T3 Recovery.

[svconfig restore](#)

Use the **restore** command to restore the system to its previous configuration. This command uses the configuration files in the /tmp folder .

svconfig clear

Use the **clear** command to erase files in the /tmp directory that were previously produced by other **svconfig** commands. You can enter this command any time after a system has been created.

Syntax

Parameters

-all

Erases all configuration files.

-q | quiet

(Optional) Suppresses console output (STDOUT).

-v on | off

(Optional) Produces verbose output (on); the default is regular output (off).

Description

This command erases configuration files on the current configured node.

You can use the **clear** command without the **-all** parameter to erase files of the form:

```
/tmp/svc.config*.sh  
/tmp/svc.config*.log
```

You can use the **clear** command with the **-all** parameter to erase files of the form:

```
/tmp/svc.config*.sh  
/tmp/svc.config*.log  
/tmp/svc.config*.xml  
/tmp/svc.config*.bak
```

An invocation example

```
svconfig clear -all
```

The resulting output:

```
No feedback
```

svconfig cron

Use the **cron** command to back up the configuration. Enter this command any time after creating the system.

Syntax

Parameters

-q, -quiet

Suppresses standard output (STDOUT) messages from the console.

-v on, -v off

Displays normal (off, the default state) or verbose (on) command messages.

Description

This command generates configuration files and places them in the configuration files directory. The file `svc.config.cron.xml_(node)` contains configuration detail. The file `svc.config.cron.log_(node)` contains a log of events. The file `svc.config.cron.sh_(node)` contains a script of the commands used to determine the configuration.

Any pre-existing file `svc.config.cron.xml_(node)` is archived as `svc.config.cron.bak_(node)`. Only one such archive is kept.

The configuration files directory is /dumps.

An invocation example

```
svconfig cron
svconfig cron -q
svconfig cron -v on
```

svconfig recover

Use the **recover** command to recover the clustered system configuration in two phases, the preparation phase and the execution phase. This is a component of T3 Recovery.

Syntax

Parameters

-execute

(Optional) Runs the command script `svc.config.recover.sh` and produces a log of events in `svc.config.recover.execute.log`.

-f, -force

(Optional) Forces continued processing where possible.

-prepare

(Optional) Verifies the current configuration against the information in `svc.config.backup.xml` on the configuration to be recovered. Prepares commands for processing in `svc.config.recover.sh`, and produces a log of events in `svc.config.recover.prepare.log`.

-q, -quiet

(Optional) Suppresses console output (STDOUT).

-v on, -v off

(Optional) Produces verbose output (on); the default is regular output (off).

Description

The **recover** command recovers the target system configuration from the `svc.config.backup.xml` file, and associated .key files (if present) in the configuration files folder.

The recover operation is performed in two phases: prepare and execute. If neither the **-prepare** nor the **-execute** option is specified, the command performs both phases in sequence, producing only a single event log: `svc.config.recover.log`.

The configuration files directory is /tmp.

An invocation example

```
svconfig recover -prepare
svconfig recover -execute
```

Related reference

svcconfig restore

Use the **restore** command to restore the system to its previous configuration. This command uses the configuration files in the /tmp folder .

Syntax

Parameters

-f | force

(Optional) Forces continued processing where possible.

-q | quiet

(Optional) Suppresses console output (STDOUT).

-prepare -fmt | fmtdisk

(Optional) Verifies the current configuration against the information in `svc.config.backup.xml`, prepares commands for processing in `svc.config.restore.sh`, and produces a log of events in `svc.config.restore.prepare`.

-execute

(Optional) Runs the command script `svc.config.restore.sh`, and produces a log of events in `svc.config.restore.execute.log`.

-fmt

(Optional) Specifies that the volume must be formatted before use. Includes the **-fmtdisk** option on all **mkvdisk** commands to be issued. You cannot specify **-fmt** with **-execute**.

-fmtdisk

(Optional) Specifies that the volume must be formatted before use. You cannot specify **-fmtdisk** with **-execute**.

-v on | off

(Optional) Produces verbose output (on); the default is regular output (off).

Description

The **restore** command restores the target system configuration from the `svc.config.backup.xml` file in the `/tmp` folder. If neither the **-prepare** nor the **-execute** option is specified, the command performs both phases in sequence, producing only a single event log: `svc.config.restore.log`.

The restore operation is also known as a T4 (Tier 4) Recovery, and can only be used on a system having just been started. The restore operation can not be used on a system having any nonautomatic objects configured, such as storage pools or volumes.

The restore operation is performed in two phases: prepare and execute.

The command pauses for eight minutes if any nodes are added during this process, informing the user of this at run-time.

An invocation example

```
svconfig restore
```

The resulting output:

```
No feedback
```

An invocation example

```
svconfig restore -prepare -fmt
```

The resulting output:

```
No feedback
```

An invocation example

```
svconfig restore -execute
```

The resulting output:

```
No feedback
```

Chapter 6. Cloud commands

Use the cloud commands to create, change, or list details about cloud-related objects. Use the cloud commands to create, change, or list details about system cloud and the SAN Volume Controller system.

cfgcloudcallhome

Use the **cfgcloudcallhome** command to configure email and metering features by using an Internet Protocol (IP) quorum server as a Simple Mail Transfer Protocol (SMTP) server on a system. This command is for IBM Spectrum Virtualize for Public Cloud only.

Syntax

➤ **cfgcloudcallhome** — **-username** — **-key** — **-ip** — **-ibmcustomer** — **-ibmcountry** ➤

Parameters

-username

(Required) Specifies the IBM Cloud® application programming interface (API) user name.

-key

(Required) Specifies the IBM Cloud API key.

-ip

(Required) Specifies the IP address of the IP quorum server.

-ibmcustomer

(Required) Specifies the customer number that is assigned when a software license is automatically added to the entitlement database. The value must be a 7 - 10-digit number.

-ibmcountry

(Required) Specifies the country ID used for entitlement and the call home system. The value is either a 3-digit number or blank.

Description

This command configures email and billing features by using an Internet Protocol (IP) quorum server as a Simple Mail Transfer Protocol (SMTP) server on a system.

An invocation example

```
# cfgcloudcallhome -username callhome1@de.ibm.com -key xxxxx -ip 192.168.0.1 -ibmcustomer  
12345678 -ibmcountry 886
```

The following output is displayed:

```
None
```

Use the **querycloudstoragecandidate** command to query the IBM Cloud storage candidate that is mapped to the system. This command is for IBM Spectrum Virtualize for Public Cloud only.

Syntax

```
➔ querycloudstoragecandidate -username -key ➔
```

Parameters

-username

(Optional) IBM Cloud API user name.

-key

(Optional) IBM Spectrum Virtualize for Public Cloud API key.

Description

This command queries the IBM Cloud storage candidate that is mapped to the clustered system.

This table describes attribute values that can be displayed as output view data.

Table 25. <i>querycloudstoragecandidate</i> output	
Attribute	Description
storage	Indicates the candidate storage name.
datacenter	Indicates the data center to which the storage belongs.
storage_type	Indicates either Endurance or Performance type. Storage type depends on the storage type when purchased.
iops	Indicates IOPS in total
capacity_gb	Indicates the capacity of storage when purchased.

An invocation example for querycloudstoragecandidate

```
$ querycloudstoragecandidate -usr qingyuanhou -key xxxxx
```

The following output is displayed:

storage	datacenter	storage_type	iops	capacity_gb
IBM01SEL571877-10	lon02	ENDURANCE	4000	100
IBM01SEL571877-11	lon02	ENDURANCE	4000	100
IBM01SEL571877-12	lon02	PERFORMANCE	40000	40

Use the **testcloudaccount** command to run diagnostics against the cloud account and report status on the results.

chcloudaccountawss3

Use the **chcloudaccountawss3** command to modify the cloud account (that uses Amazon S3 storage) parameters or mode.

Syntax

Parameters

-name *name*

(Optional) Specifies the new or modified cloud account name. The value must be an alphanumeric value.

-accesskeyid *aws_access_key_id*

(Optional) Specifies the value for the public part of the Amazon Web Services (AWS) access key. Use this access key to access cloud storage.

-secretaccesskey *aws_secret_access_key*

(Optional) Specifies the value for the private part of the Amazon Web Services (AWS) access key. This access key is for the AWS user that the system uses to access cloud storage.

-ignorefailures

(Optional) Changes the access key whether the new access key works.

-mode *import* / *normal*

(Optional) Specifies the new or modified cloud account mode. The values are *import* or *normal*.

-importsystem *import_system_id*

(Optional) Specifies that the system's data be imported.

Note: You must specify *-mode import* first.

-certificate *path_to_certificate*

(Optional) Specifies the path for the SSL certificate to use when you authenticate to the new or modified cloud account storage. The value must be an alphanumeric string of 1 - 255 characters (in base64-encoded PEM format).

-nocertificate

(Optional) Specifies that the custom SSL certificate that was used to authenticate to the new or modified cloud account storage is used to stop the system.

-refresh

(Optional) Specifies a refresh of the system import candidates. If the account is in *import* mode, this parameter specifies a refresh of the data available for import.

-downbandwidthmbits *downbandwidth_limit_in_mb*

(Optional) Specifies the download bandwidth limit in megabits per second (Mbps). The value must be a number 1 - 10240.

-upbandwidthmbits *upbandwidth_limit_in_mb*

(Optional) Specifies the upload bandwidth limit in megabits per second (Mbps). The value must be a number 1 - 10240.

-resetusagehistory

(Optional) Resets the usage history (to 0). Storage consumption that reflects the space that is consumed on the cloud account is cumulative, which means that it remains in the current day row (the 0th row).

cloud_account_id* / *cloud_account_name

(Required) Specifies the cloud account ID or name to modify. The value for the ID must be a number and the value for the name must be an alphanumeric string.

Description

This command modifies the parameters for the cloud account (created by using **mk1cloudaccountawss3**) that uses Amazon S3 storage.

The **-mode** parameter, the **-refresh** parameter, and any of the user credentials parameters groups are mutually exclusive.

This command fails and no changes are made if the supplied credentials do not provide authentication. Credentials include:

- **-accesskeyid**
- **-secretaccesskey**
- **-certificate** or **nocertificate**

For example, if the network is down then the system cannot confirm that a new secret access key is valid, the command fails. Specify **-ignorefailures** to overwrite this feature. If you specify invalid credentials but you do specify **-ignorefailures**, an online account becomes offline and an error is generated in the error log that describes the authentication failure.

The secret access key is sensitive system information and is stored in encrypted form. It is not available in the system dumps and in the audit log it is replaced with six hash ("#") symbols.

If you specify this command against an offline account and these new details enable the account to start working (for example, you enter an expired password) the account becomes online.

You must change the mode if the account is not being used by any system volumes. A mode change requires the account to be online and the system be able to communicate with the cloud server.

Note: You can have a maximum of:

- One cloud account per system.
- 1024 volumes with cloud snapshots enabled.
- 256 cloud snapshots per volume.
- 512 volume groups.

An invocation example

```
chcloudaccountawss3 -name myamazon cloudaccount0
```

The resulting output:

```
No feedback
```

An invocation example

```
chcloudaccountawss3 -mode import -importsystem 000002007D40A162 0
```

The resulting output:

```
No feedback
```

An invocation example

```
chcloudaccountawss3 -upbandwidthmbits 100 -downbandwidthmbits 100 cloudaccount0
```

The resulting output:

```
No feedback
```

mkcloudaccountaws3

Use the **mkcloudaccountaws3** command to configure a new cloud account that uses Amazon S3 object storage.

mkcloudaccountswift

Use the **mkcloudaccountswift** command to configure a new cloud account that uses OpenStack Swift object storage.

rmcloudaccount

Use the **rmcloudaccount** command to delete a cloud account from the system.

sendcloudcallhome

Use the **sendcloudcallhome** command to send Call Home information directly to a server in the Cloud.

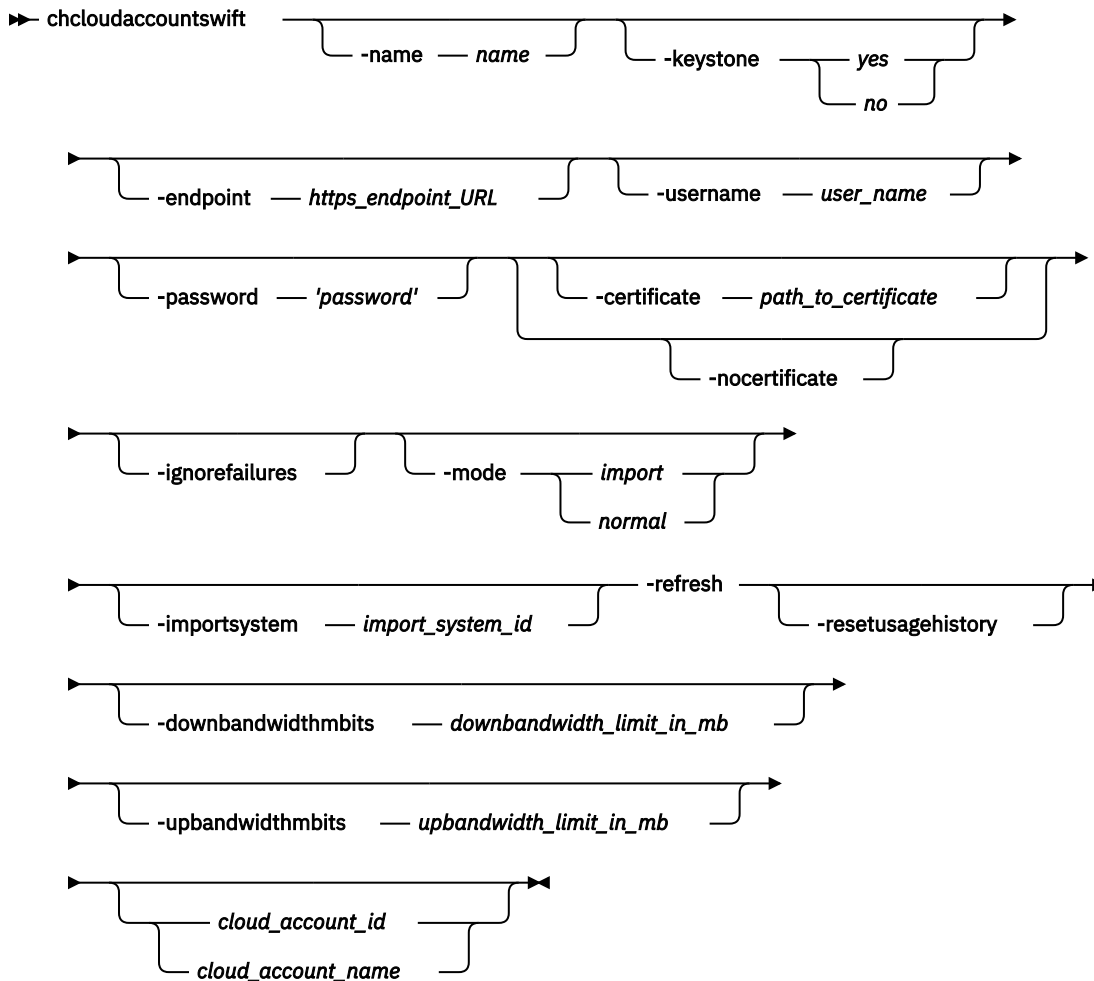

testcloudaccount

Use the **testcloudaccount** command to run diagnostics against the cloud account and report status on the results.

chcloudaccountswift

Use the **chcloudaccountswift** command to modify the cloud account (that uses OpenStack Swift storage) parameters or mode.

Syntax

Parameters

-name *name*

(Optional) Specifies the new or modified OpenStack name you must use to access cloud account storage. The value must be an alphanumeric value.

-keystone *yes / no*

(Optional) Specifies that keystone authentication is used. The values are *yes* or *no*.

-endpoint *https_endpoint_URL*

(Optional) Specifies the URL (that the system uses to access object storage) to change for the cloud account. If OpenStack Keystone authentication is used, the URL specified must be the URL for the Keystone authentication. If Keystone authentication is not used, the URL specified must be the URL for the Swift account. The value must be 8 - 128 characters and must be a valid URL address.

-username *user_name*

(Optional) Specifies the OpenStack user name that the system must use to access cloud account storage.

-password *'password'*

(Optional) Specifies the password value to use to authenticate to cloud storage. For IBM Cloud accounts, this password is the application programming interface (API) key. The value must be 1 - 64 alphanumeric characters and it must not begin or end with a space. [You must enclose the password in single quotation marks.](#)

-certificate *path_to_certificate*

(Optional) Specifies the path for the SSL certificate to use when you authenticate to new or modified cloud account storage. The value must be an alphanumeric string of 1 - 255 characters (in base64-encoded PEM format).

-nocertificate

(Optional) Specifies that the custom SSL certificate that was used to authenticate to the new or modified cloud account storage is used to stop the system.

-ignorefailures

(Optional) Specifies that the access key is changed whether or not the new access key works.

-mode *import* / *normal*

(Optional) Specifies the new or modified cloud account mode. The values are *import* or *normal*.

-importsystem *import_system_id*

(Optional) Specifies that the system's data be imported.

Note: You must specify *-mode import* first.

-refresh

(Optional) Specifies a refresh of the system import candidates. If the account is in *import* mode, this parameter specifies a refresh of the data available for import.

-downbandwidthmbits *downbandwidth_limit_in_mb*

(Optional) Specifies the download bandwidth limit in megabits per second (Mbps). The value must be a number 1 - 10240.

-upbandwidthmbits *upbandwidth_limit_in_mb*

(Optional) Specifies the upload bandwidth limit in megabits per second (Mbps). The value must be a number 1 - 10240.

-resetusagehistory

(Optional) Resets the usage history (to 0). Storage consumption that reflects the space that is consumed on the cloud account is cumulative, which means that it remains in the current day row (the 0th row).

cloud_account_id* / *cloud_account_name

(Required) Specifies the cloud account ID or name to modify. The value for the ID must be a number and the value for the name must be an alphanumeric string.

Description

This command modifies the parameters for the cloud account (created by using **mklcloudaccountswift**) that uses OpenStack Swift storage.

At least one parameter must be set.

The **-mode** parameter, the **-refresh** parameter, and any of the user credentials parameters groups are mutually exclusive. Credentials include:

- **-keystone**
- **-endpoint**
- **-username**
- **-password**
- **-certificate** or **nocertificate**

The command fails if the supplied authentication credentials are unsuccessful. For example, if the network is down the system cannot confirm that the `secretaccesskey` is valid (and the command fails).

Specify **-ignorefailures** to override this feature. If you specify incorrect credentials and the **-ignorefailures** parameter, an online account becomes offline and an error is generated in the log describing the authentication failure.

The password is treated as sensitive system information. It is stored in an encrypted form and not available in system dumps. In the audit log, it is replaced with six hash ("#") symbols.

If a certificate is supplied and the command succeeds, the certificate file is deleted from the local file system.

If you specify this command against an offline account and these new details enable the account to start working (for example, you enter a new password against an expired password) the account becomes online.

You can change the mode if the account is not being used by any system volumes. A mode change requires the account to be online and the system be able to communicate with the cloud server.

Note: You can have a maximum of:

- One cloud account per system
- 1024 volumes with cloud snapshots enabled
- 256 cloud snapshots per volume
- 512 volume groups

An invocation example

```
chcloudaccountswift -certificate /tmp/new-cert.pem -ignorefailures myswift
```

The resulting output:

```
No feedback
```

An invocation example

```
chcloudaccountswift -mode import -importsystem 000002007D40A162 0
```

The resulting output:

```
No feedback
```

An invocation example

```
chcloudaccountawss3 -username newuser -password 'simpsons' 0
```

The resulting output:

```
No feedback
```

An invocation example

```
chcloudaccountswift -upbandwidthmbits 100 -downbandwidthmbits 100 cloudaccount0
```

The resulting output:

```
No feedback
```

chcloudcallhome

Use the **chcloudcallhome** command to enable or disable the Cloud Call Home function.

Syntax

➔ **chcloudcallhome** 

Parameters

-enable

(Required) Call Home data is sent directly to the Cloud. This parameter is the default setting.

-disable

(Required) Call Home data is not sent to the Cloud.

Description

This command allows configuration changes to Cloud Call Home.

Note: The **-enable** and **-disable** parameters are mutually exclusive.

An invocation example

```
chcloudcallhome -enable
```

The following output is displayed:

```
No feedback
```

lscloudaccount

Use the **lscloudaccount** command to display information about the configured cloud accounts.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

cloud_account_id / cloud_account_name

(Optional) Specifies the name or ID for the detailed view of the account.

Description

This command displays information about configured cloud accounts.

This table provides the attribute values that can be displayed as output view data.

Table 26. lscloudaccount output	
Attribute	Description
id	Indicates the cloud account ID. The value is a number.
name	Indicates the cloud account name. The value is an alphanumeric string.
type	Indicates the cloud account provider. The values are <i>awss3</i> or <i>swift</i> .
status	Indicates the cloud account status. The values are <i>online</i> or <i>offline</i> .
mode	Indicates the cloud account mode. The values are <i>normal</i> or <i>import</i> .
active_volume_count	Indicates the number of volumes in the system that use the account. The value must be a number.

Table 26. **lscloudaccount** output (continued)

Attribute	Description
backup_volume_count	Indicates the number of volumes that are backed up to the cloud account. The value must be a number.
import_system_id	Indicates the system ID for the system from where the data is being imported. The value must be a 16-character uppercase hexadecimal number (or blank).
import_system_name	Indicates the system name from where the data is being imported. The value must be an alphanumeric string (or blank).
error_sequence_number	Indicates an error (for offline accounts). The value must be a number (or blank).
refreshing	Indicates whether the system is refreshing its cloud storage view (for import mode accounts). The values are yes or no.
backup_timestamp	Indicates the timestamp for the most recent backup. The value must be in the format YYMMDDHHMMSS (or blank).
certificate	Indicates whether SSL is configured for an account that uses certificates. The values are yes or no.
certificate_expiry	Indicates the time and date that a certificate expires. The value must be blank or be in this format: Dec 7 10:07:59 2015 GMT
endpoint	Indicates the endpoint URL for swift accounts. The value must be a valid URL (or blank).
awss3_bucket_prefix	Indicates the bucket prefix that is being used for S3 accounts. The value must be a valid bucket prefix (or blank).
awss3_access_key_id	Indicates the user access key ID for S3 accounts. The value must be a valid access key ID (or blank).
awss3_region	Indicates the region that is chosen for cloud storage for S3 accounts. The value must be for a valid AWS region (or blank).
swift_keystone	Indicates whether keystone authentication is in use. The value must be yes or no.
swift_container_prefix	Indicates the container prefix for Swift accounts. The value must be a valid container prefix or blank.
swift_tenant_name	Indicates the tenant name that is used for authentication for swift accounts. The value must be a valid tenant name (or blank).
swift_user_name	Indicates the user name that is used for authentication for swift accounts. The value must be a valid user name (or blank).
encrypt	Indicates the encryption status for the cloud account. The values are yes and no.

A concise invocation example

```
lscloudaccount
```

The resulting output:

```
id name      type  status mode  active_volume_count backup_volume_count import_system_id
import_system_name error_sequence_number
0 importer swift online import 2          123          000002007D40A162
cluster1
```

A detailed invocation example

```
lscloudaccount 1
```

The resulting output:

```
id 0
name varyja
type swift
status online
mode normal
active_volume_count 0
backup_volume_count 1
import_system_id
import_system_name
error_sequence_number
refreshing no
backup_timestamp 151021114002
certificate yes
certificate_expiry Dec  7 10:07:59 2017 GMT
endpoint https://thesecurecloud.company.com:4000/auth/v3.0
awss3_bucket_prefix
awss3_access_key_id
awss3_region
swift_keystone yes
swift_container_prefix svc-1
swift_tenant_name mytenant
swift_user_name storeman
```

lscloudaccountusage

Use the **lscloudaccountusage** command to list usage information about configured cloud storage accounts.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

cloud_account_id | cloud_account_name

(Optional) Specifies the cloud account to list details for. The ID value must be a number and the name value must be an alphanumeric string.

Description

This command displays usage information about configured cloud storage accounts. The information involves chargeable resource usage.

This table provides the attribute values that can be displayed as output view data.

Table 27. *lscloudaccountusage* output

Attribute	Description
id	Indicates the ID for the cloud account. The value must be a number 0 - 4294967295.
name	Indicates the name for the cloud account. The value must be an alphanumeric string.
date	Indicates the date for the system data that is displayed. Each row shows usage of one day. The value must be in YYYYMMDD format. This value is computed relative to the current configured system date. The date in the very first entry must equate to the current date. If you manually change the system date, the changes are not reflected in the output for the date field until midnight (the time 00:00). If you change your system date got to accommodate time zone changes, it is reflected in the output instantly. After midnight, any subsequent entry is for the next 24-hour period.
upload_data_mb	Indicates the uploaded data for one day. The value must be a number 0 - 18446744073709551615.
download_data_mb	Indicates the downloaded data for one day. The value must be a number 0 - 18446744073709551615.
storage_consumed_gb	Indicates the volume of data that is stored in this cloud account. The value must be a number 0 - 18446744073709551615.

Note: For a detailed view, there are 180 rows. Each row has information corresponding to one full day, and every field reflects activity for that day except for the `storage_consumed_gb`, which is cumulative. The most recent entry reflects the current day.

An invocation example

```
lscloudaccountusage
```

The resulting output:

id	name	date	upload_data_mb	download_data_mb
0	cloudaccount0	20151023	194560	900
1	cloudaccount1	20151023	204800	1500

An invocation example

```
lscloudaccountusage 0
```

The resulting output:

id	name	date	upload_data_mb
0	cloudaccount0	20151023	194560
900	cloudaccount0	20151022	3584000
150	cloudaccount0	20151021	1024
17152	cloudaccount0

lscloudaccountimportcandidate

Use the **lscloudaccountimportcandidate** command to list information about systems that have data that is stored in the cloud accounts that are defined on this system.

Syntax

➔ **lscloudaccountimportcandidate**  **-nohdr** **-delim** *delimiter*

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

Description

This command lists information about systems that have data that is stored in the cloud accounts that are defined on this system.

This command provides information about the valid options for `chcloudaccount -import`. To refresh the view by reloading what is on the cloud server, specify `chcloudaccount -refresh`.

This table provides the attribute values that can be displayed as output view data.

Table 28. <i>lscloudaccountimportcandidate</i> output	
Attribute	Description
cloud_account_id	Indicates the ID for the cloud account that contains data from another system. The value must be a numeric string.
cloud_account_name	Indicates the name for the cloud account that contains data from another system. The value must be an alphanumeric string.
import_system_id	Indicates the system ID of the system that has data on the cloud account. The value must be a 16-character string in hexadecimal uppercase.
import_system_name	Indicates the system name of the system that has data on the cloud account. The value must be an alphanumeric string.
backup_volume_count	Indicates the number of volumes that are backed up by the imported system. The value must be a numeric string.
backup_size	Indicates the approximate amount of cloud storage that is in use by snapshots from the imported system.
backup_timestamp	Indicates the timestamp of the most recent volume backup (by the other system). The value must be in the YYMMDDHHMMSS format or be blank. This value is displayed in UNIX time.

An invocation example

```
lscloudaccountimportcandidate
```

The resulting output:

```
cloud_account_id cloud_account_name import_system_id import_system_name backup_volume_count
backup_size backup_timestamp
0 my_amazon 00002007D40A162 cluster1 0
0.00GB
```

Use the **mkcloudaccountswift** command to configure a new cloud account that uses OpenStack Swift object storage.

[rmcloudaccount](#)

Use the **rmcloudaccount** command to delete a cloud account from the system.

[sendcloudcallhome](#)

Use the **sendcloudcallhome** command to send Call Home information directly to a server in the Cloud.

[testcloudaccount](#)

Use the **testcloudaccount** command to run diagnostics against the cloud account and report status on the results.

lscloudcallhome

Use the **lscloudcallhome** command to view the status of the Call Home information that is sent to a server in the Cloud.

Syntax

➡ **lscloudcallhome** ➡

Parameters

No parameters are available for this command.

Description

This command displays the status of Call Home information that is sent directly to a server in the Cloud. This table shows the possible output:

Table 29. <i>lscloudcallhome</i> output	
Attribute	Description
status	Displays the status of the Cloud Call Home function. The possible values are unsupported, disabled, or enabled.
connection	Displays the connection state to the server. The possible values are: <ul style="list-style-type: none">• active - A good connection exists to the servers in the Cloud.• error - A connection error exists. The error value that is displayed in the error_sequence_number field details the event log number that contains further information about the connection error.• untried - A value of untried occurs directly after enabling cloud call home when the system is waiting for the results of a connection test.
error_sequence_number	Indicates the error sequence number that describes the cause of the connection error.
last_success	Displays the date and time of the last successful message that was sent. The format is YYMMDDhhmmss.
last_failure	Displays the date and time of the last message failure. When there is a working active connection failure that is older than 24 hours, this field is blank. The format is YYMMDDhhmmss.

An invocation example

```
lscloudcallhome
```

The following output is displayed:

```
status enabled
connection active
error_sequence_number
last_success 190125062146
last_failure 190124092257
```

An invocation example

```
lscloudcallhome
```

The following output is displayed:

```
status enabled
connection error
error_sequence_number 115
last_success 190125062146
last_failure 190127125734
```

An invocation example

```
lscloudcallhome
```

The following output is displayed:

```
status enabled
connection active
error_sequence_number
last_success 190128175144
last_failure
```

Use the **testcloudaccount** command to run diagnostics against the cloud account and report status on the results.

mkcloudaccountawss3

Use the **mkcloudaccountawss3** command to configure a new cloud account that uses Amazon S3 object storage.

Syntax

Parameters

-name *name*

(Optional) Specifies the name for the cloud account. The value must be an alphanumeric string.

-bucketprefix *bucket_prefix*

(Required) Specifies the prefix for the S3 bucket names that the system uses. The value must be a lower-case alphabetic string 3 - 58 characters long (with no dot or period at the end of the string, and no dot or period next to another dot or period).

-accesskeyid *aws_access_key_id*

(Required) Specifies the public part of the Amazon Web Services (AWS) access key credential of the AWS user that the system use to access the cloud storage. The value must be a 20-character alphanumeric string of uppercase letters and numbers.

-secretaccesskey *aws_secret_access_key*

(Required) Specifies the non-public part of the AWS access key credential that the system use to access the cloud storage. The value must be a 40-character alphanumeric string (That can contain slashes, or "/").

-certificate *path_to_certificate*

(Optional) Specifies the path to an SSL certificate authority (CA) certificate for AWS S3. The value must be an alphanumeric string of 1 - 255 characters (in base64-encoded PEM format).

-upbandwidthmbits *upbandwidth_limit_in_mb*

(Optional) Specifies the upload bandwidth limit in megabits per second (Mbps). The value must be a number 1 - 10240.

-downbandwidthmbits *downbandwidth_limit_in_mb*

(Optional) Specifies the download bandwidth limit in megabits per second (Mbps). The value must be a number 1 - 10240.

-region *aws_region*

(Optional) Specifies the AWS region to use to access the cloud account and store data.

-encrypt yes / no

(Optional) Specifies whether to encrypt the data in the cloud account. By default, encryption is enabled unless you specify `-encrypt no`.

Description

This command configures a new cloud account that uses Amazon S3 object storage.

An invocation example

```
mkcloudaccountawss3 -name myamazon
                    -bucketprefix svc_backups
                    -accesskeyid AKIAIOSFODNN7EXAMPLE
                    -secretaccesskey wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY
                    -upbandwidthmbits 100
                    -downbandwidthmbits 100
```

The resulting output:

```
Cloud Account, id [0], successfully created
```

Note: If the system contains an encrypted cloud account that uses USB encryption, a USB flash drive with the system master key must be present in the configuration node before the cloud account can move to the online state. This requirement is necessary when the system is powered down, and then restarted.

Use the **mkcloudaccountswift** command to configure a new cloud account that uses OpenStack Swift object storage.

rmcloudaccount

Use the **rmcloudaccount** command to delete a cloud account from the system.

sendcloudcallhome

Use the **sendcloudcallhome** command to send Call Home information directly to a server in the Cloud.

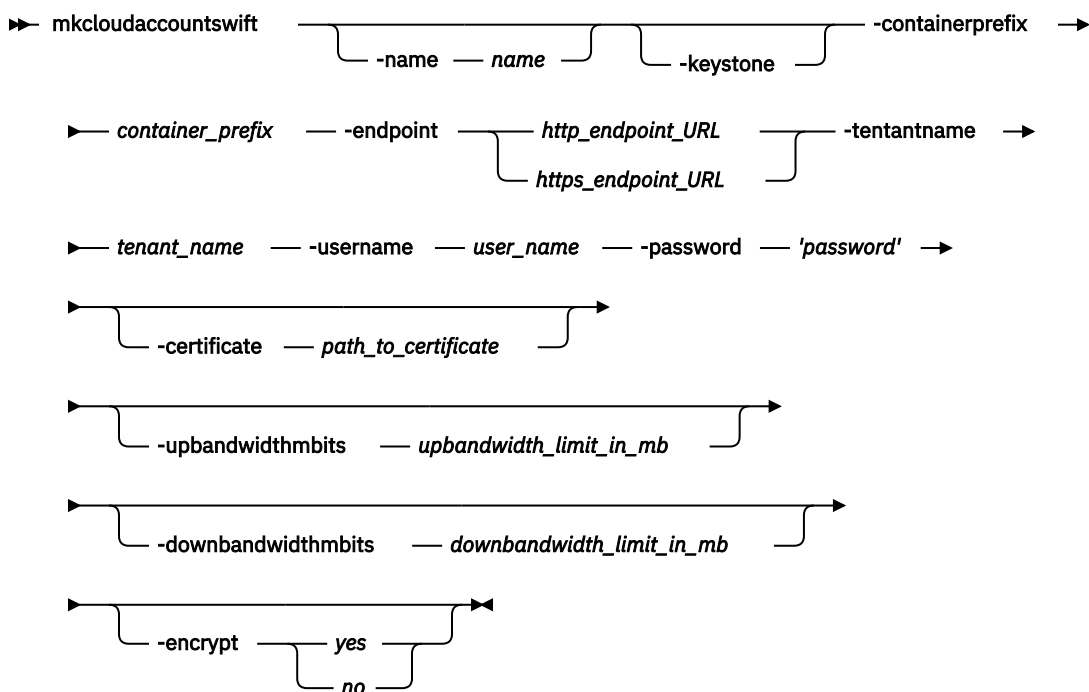

testcloudaccount

Use the **testcloudaccount** command to run diagnostics against the cloud account and report status on the results.

mkcloudaccountswift

Use the **mkcloudaccountswift** command to configure a new cloud account that uses OpenStack Swift object storage.

Syntax

Parameters

-name *name*

(Optional) Specifies the account identifier. The value must be an alphanumeric string.

-keystone

(Optional) Specifies that the system authenticate with OpenStack Keystone. If you do not specify this parameter, the system authenticates with OpenStack TempAuth.

-containerprefix *container_prefix*

(Required) Specifies the Swift container names the system uses or creates. The value must be 1 - 12 characters and contain no spaces or slashes.

-endpoint *http_endpoint_URL* / *https_endpoint_URL*

(Required) Specifies the URL that the system uses to access object storage.

If Keystone authentication is used, it is the URL of the Keystone service, probably ending with *v2.0*. Otherwise, it is the URL of the Swift service.

-tenantname *tenant_name*

(Required) Specifies the OpenStack tenant the system uses to access cloud storage. The value must be a 1 - 64 alphanumeric characters that contain no spaces.

-username *user_name*

(Required) Specifies the OpenStack user name the system uses to access cloud storage. The value must be 1 - 255 alphanumeric characters with no spaces.

-password '*password*'

(Required) Specifies the password that the system uses to access cloud storage. For IBM Cloud accounts, this password is the application programming interface (API) key. The value must be 1 - 64 alphanumeric characters and it must not begin or end with a space. [You must enclose the password in single quotation marks.](#)

-certificate *path_to_certificate*

(Optional) Specifies the file path for the object storage server SSL certificate. The value must be:

- 1 - 255 alphanumeric characters with no period or dot next to another period or dot, and no period or dot at the start or end of the specified value
- In base64-encoded PEM format

-upbandwidthmbits *upbandwidth_limit_in_mb*

(Optional) Specifies the upload bandwidth limit in megabits per second (Mbps). The value must be a number 1 - 10240.

-downbandwidthmbits *downbandwidth_limit_in_mb*

(Optional) Specifies the download bandwidth limit in megabits per second (Mbps). The value must be a number 1 - 10240.

-encrypt *yes / no*

(Optional) Specifies whether to encrypt the data in the cloud account. By default, encryption is enabled unless you specify `-encrypt no`.

Description

This command configures a new cloud account that uses OpenStack Swift object storage.

An invocation example

```
mkcloudaccountswift -containerprefix svc_backups
                    -endpoint https://lon02.objectstorage.cloud.net/auth/v1.0
                    -tenantname mytenant
                    -username jamivard
                    -password 'WKf84FAQRKLOICDF53LANBWKf84FAQRKLOICDF53LANBEXAMPLEEXAMPLEEXAMPL '
                    -upbandwidthmbits 100
                    -downbandwidthmbits 100
```

The resulting output:

```
Cloud Account, id [0], successfully created
```

Note: If the system contains an encrypted cloud account that uses USB encryption, a USB flash drive with the system master key must be present in the configuration node before the cloud account can move to the online state. This requirement is necessary when the system is powered down, and then restarted.

testcloudaccount

Use the **testcloudaccount** command to run diagnostics against the cloud account and report status on the results.

rmcloudaccount

Use the **rmcloudaccount** command to delete a cloud account from the system.

Syntax

➤ **rmcloudaccount** 

Parameters

cloud_account_id / cloud_account_name

(Required) Specifies the cloud account to remove. The ID value must be a number and the name value must be an alphanumeric string.

Description

This command deletes a cloud account from the system. If no systems have volume data that is stored in the account, the containers are deleted from the cloud storage.

As long as there are no volumes on this system that are using the cloud account, the command deletes the account. If there are no volumes that are left in the account, the system attempts to delete its containers. If you cannot connect to the cloud server, the containers are not deleted. If the command times out, the deletion proceeds asynchronously and the account object is removed.

An invocation example

```
rmcloudaccount VardyAmazAcct
```

The resulting output:

```
No feedback
```

sendcloudcallhome

Use the **sendcloudcallhome** command to send Call Home information directly to a server in the Cloud.

Syntax

```
➔ sendcloudcallhome -connectiontest -uploadtest -inventory ➔
```

Parameters

-connectiontest

(Required) Initiates a connection check to a server in the Cloud. The command **svcinfo lscloudcallhome** shows the results whether a successful connection is achieved.

-uploadtest

(Required) Uploads a test message to IBM Support. A confirmation receipt is sent via email.

-inventory

(Required) Sends the current inventory to a server in the Cloud.

Description

The Call Home feature must be enabled with the **chcloudcallhome** command.

Note: The **-connectiontest**, **-uploadtest**, and **-inventory** parameters are mutually exclusive.

An invocation example

```
sendcloudcallhome -uploadtest
```

The following output is displayed:

```
No feedback
```

testcloudaccount

Use the **testcloudaccount** command to run diagnostics against the cloud account and report status on the results.

testcloudaccount

Use the **testcloudaccount** command to run diagnostics against the cloud account and report status on the results.

Syntax

➔ testcloudaccount 

Parameters

cloud_account_id / cloud_account_name

(Required) Specifies the cloud account to test. The ID value must be a number and the name value must be an alphanumeric string.

Description

This command runs diagnostics against the cloud account and reports status, which includes network connectivity, authentication, and cloud storage usage.

This command can be run against an online or offline account.

- If the command is run successfully against an offline account, the account becomes online.

- If the command is run unsuccessfully against an online account, the account becomes offline.

An invocation example

```
testcloudaccount MyVardyAccount
```

The resulting output:

```
Cloud Account, id [0], successfully tested
```

Chapter 7. Clustered system commands

Use the system commands to monitor and modify systems and their properties.

addnode (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

Syntax

Parameters

-panelname *panel_name*

(Required if you do not specify the **-wwnodename** parameter) Specifies the node that you want to add to a system by the name that is displayed in the management GUI, the service assistant, or displayed by specifying **lsnodecandidate**. You cannot use this parameter with the **-wwnodename** parameter.

Note: If *panel_name* is not supplied, it applies to the node on which the command is running.

-wwnodename *wwnn_name*

(Required if you do not specify the **-panelname** parameter) Specifies the node that you want to add to the system by the worldwide node name (WWNN). You cannot use this parameter with the **-panelname** parameter.

-name *node_name*

(Optional) Specifies a name for the node that you want to add to the system. You can use this name in subsequent commands to refer to the node, instead of using the node ID.

Note: Node names that are supplied with the **-name** parameter on the **addnode** and **chnode** commands must not already be in use as node names or as node *failover_names*.

If you assign a name, this name is displayed as the node name from then on. If you do not assign a name, a default name is used. The default name that is used depends on whether the node is replacing one that was previously deleted. When a node is deleted, its name is retained in the I/O group as the failover name of its partner node. If no nodes remain in an I/O group, no failover names are retained. Only one failover name can be stored for each node. If you add a node into an I/O group that has a retained failover name and do not specify a node name, the retained failover name is assigned to this node. If you do not specify a name and there is no retained failover name, the name that is assigned has the format *nodeX*.

Important: The iSCSI Qualified Name (IQN) for each node is generated using the system and node names. If you are using the iSCSI protocol and the target name for this node is already active on its partner node, and iSCSI hosts are attached to it, adding the node with a different name changes the IQN of this node in the system and might require reconfiguration of all iSCSI-attached hosts.

-spare

(Optional) Specifies that the node that is being added is a spare node and not an I/O node group member. You cannot specify this parameter with **-iogrp**.

-iogrp iogroup_name / iogroup_id

(Required) Specifies the I/O group to which you want to add this node. You cannot specify this parameter with **-spare**.

-site site_name / site_id

(Optional) Specifies the numeric site value or site name of the new node.

If the system topology is hyperswap and the I/O group has a configured node, this new node must be located within the same site. If no configured nodes exist in the I/O group (but volumes are defined in the I/O group that are in active-active relationships) this new node must be located within the same site as any node that was previously in that I/O group.

Remember:

- This parameter must be specified whether the system topology is set to stretched or hyperswap.
- If the system topology is stretched and the I/O group has a configured node, this new node must be in another site location.

Description

Note: The **addnode** command is a SAN Volume Controller command. For Storwize V7000, use the **addcontrolenclosure** command.

This command adds a node to the system. You can obtain a list of candidate nodes (nodes that are not already assigned to a system) by typing **lsnodecandidate**. You cannot add a node with less memory than any potential partner nodes that are in the I/O group.

Note: The **lsnodecandidate** command is a SAN Volume Controller command. For Storwize V7000, use the **lscontrolenclosurecandidate** command.

You can create thin-provisioned volumes in a data reduction storage pool on all node types. Compressed volumes in a data reduction storage pool must be created in an I/O group with node types that support compression. Nodes that support compression can be added to an I/O group that contains compressed volumes.

You cannot use this command if the new node is:

- Not capable of encryption but the existing I/O group partner is capable of encryption.
- Not capable of encryption but storage pools exist with encryption keys that include MDisk that are not self-encrypting.
- Capable of encryption but the node or enclosure has no encryption license.

If encryption is enabled on the system, then a new encryption licence for each new MTM serial must be installed by using the management GUI before the new node or enclosure can be added to the system.

Note: This command is successful only if the node-enclosure system ID matches the system, or is blank.

When the first thin or compressed volume in a data reduction pool is created for an IO group, the IO group sets CPU parameters based on the lowest number of CPU resources available based on the nodes in the I/O group. A new node with less CPU resources cannot be added to the I/O group.

Before you add a node to the system, you must check to see if any of the following conditions are true. If the following conditions exist, failure to follow the procedures that are documented here might result in the corruption of all data that is managed by the system.

- Is the new node being used to replace a failed node in the system?
- Does the node being added to the system use physical node hardware that has been used as a node in another system, and are both system recognized by the same hosts?

If any of the previous conditions are true, you must take the following actions:

1. Add the node to the same I/O group that it was previously in. You can use the command-line interface command **lsnode** or the management GUI to determine the WWNN of the system nodes.
2. Shut down all of the hosts that use the system before you add the node back into the system.
3. Add the node back to the system before the hosts are restarted. If the I/O group information is unavailable or it is inconvenient to shut down and restart all of the hosts that use the system, you can do the following:
 - a. On all of the hosts that are connected to the system, unconfigure the Fibre Channel adapter device driver, the disk device driver, and the multipathing driver before you add the node to the system.
 - b. Add the node to the system, and then reconfigure the Fibre Channel adapter device driver, the disk device driver, and multipathing driver.

If you are adding a node to a system, take the following actions:

1. Ensure that the model type of the new node is supported by the code level for the system. If the model type is not supported by the system code, you must upgrade the system to a version of code that supports the model type of the new node.
2. Record the node serial number, the WWNN, all WWPNNs, and the I/O group to which the node is added. You might need to use this information later. Having it available can prevent possible data corruption if the node must be removed from and re-added to the clustered system.

Note: Transparent cloud tiering can be enabled on a system if every node on the system supports it. If a system supports transparent cloud tiering, you cannot add nodes that do not support it to the system.

Other considerations when you add a node to a system:

When you add a node to the system by using the **addnode** command or the system GUI, you must confirm whether the node has previously been a member of the system. If it has, follow one of these two procedures:

- Add the node to the same I/O group that it was previously in. You can determine the WWNN of the nodes in the system by using the **lsnode** command.
- If you cannot determine the WWNN of the nodes in the cluster, call the support team to add the node back into the system without corrupting the data.

When a node is added to a system, it displays a state of adding. It can take 30 minutes for the node to be added to the system, particularly if the version of code that is associated with the node changed.

Attention: If the node remains in the adding state for more than 30 minutes, contact your support representative to assist you in resolving this issue.

When a node is deleted, its name is retained in an I/O group as the failover name of its partner node. If no nodes remain in an I/O group, no failover names are retained.

The **addnode** command fails if you specify a name that is either an existing node name or a retained failover name, or if the system has a configuration that exceeds the limits for the node that is being added. Specify a different name for the node that is being added.

Compressed or thin deduplicated volumes can be added only to systems in which all nodes support deduplicated volumes. You can only add nodes that support deduplicated volumes to a system that contains compressed or thin deduplicated volumes. Nodes can only be added to a system that contains compressed or thin deduplicated volumes if that new node can support the amount of memory that is allocated for data deduplication in the target I/O group.

An invocation example

```
addnode -wwnname 5005076801e08b -iogrp io_grp0
```

The resulting output:

```
Node, id [6], successfully added
```

An invocation example

```
addnode -panelname 123456 -iogrp 1 -site 2
```

The resulting output:

```
Node, id [6], successfully added
```

An invocation example

```
addnode -wwnname 5005076801e08b -iogrp io_grp0 -site site1
```

The resulting output:

```
Node, id [6], successfully added
```

An invocation example

```
addnode -panelname 123456 -spare
```

The resulting output:

```
Node, id [7], successfully added
```

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster](#) (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands.

All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

Isclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezone

Use the **lstimezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setssystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

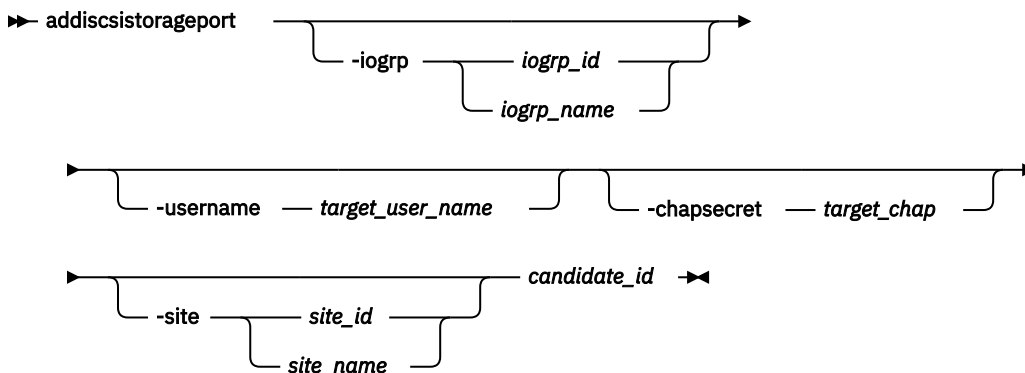

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

addiscsistorageport

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

Syntax

Parameters

-iogrp iogrp_id | iogrp_name

(Optional) Specifies I/O group ID or name that is added. The *iogrp_id* value must be 0, 1, 2, or 3. The *iogrp_name* value must be an alphanumeric string.

Specifying this parameter triggers discovery through both nodes for the specified I/O group. The port number on each node (used to establish a session) is displayed in the selected row of discovery results from specifying **detectiscsistorageportcandidate**.

-username *target_user_name*

(Optional) Specifies the target controller user name that is added. The value must be an alphanumeric string up to 256 characters.

If the target controller requires a *target_user_name* and *target_chap* for discovery, the user name for the target controller must be specified.

Some controllers might require that you use the iSCSI qualified name (IQN) user name for discovery. Each nodes IQN is picked up automatically and used if required.

-chapsecret *target_chap*

(Optional) Specifies the Challenge-Handshake Authentication Protocol (CHAP) secret, *target_chap*, that is required for discovery of the target iSCSI controller that is being added. The value must be an alphanumeric string (case-sensitive) up to 79 characters. This keyword is required if **-username** is specified.

-site *site_id* / *site_name*

(Optional) Specifies the site ID or site name of the host that is being detected. The site ID must be 1 (the default) or 2. The site name must be an alphanumeric value.

Important: This parameter must be specified for a HyperSwap or stretched system.

For a HyperSwap or stretched cluster topology, the site ID must be specified to make sure that attempts to establish a session are made from nodes in the same site as the iSCSI storage controller.

candidate_id

(Required) Indicates the row ID indicating the selected row in the **lsiscsistorageportcandidate** output.

Description

This command establishes iSCSI login sessions from a specified I/O group (or, if I/O group is not specified, the entire clustered system) to a discovered backend iSCSI target controller.

To use this command, you must first:

1. Specify **detectiscsistorageportcandidate** to detect or discover the backend controller target ports.
2. Specify **lsiscsistorageportcandidate** to display the discovery output and locate a unique IQN and Internet Protocol (IP) combination on the discovered iSCSI storage controller.
3. Specify **addiscsistorageport**. You can establish sessions (from all nodes in a single I/O group) to the iSCSI controller port by specifying the I/O group number of the source port that the iSCSI sessions are initiated from.

If you do not specify an I/O group, sessions are established from all nodes in the system. The source port identifier is in the discovery results. Because some iSCSI controllers represent logical unit numbers (LUNs) as IQNs and might require a different *target_user_name* and *target_chap* for every IQN, these values can also specified for authentication when establishing the session.

Note: You can use the **chiscsistorageport** command to add more initiator node authentication credentials.

A detailed invocation example

This example shows target discovery that uses an IPv4 IP address for a target iSCSI controller through source port ID 0. For example, first you might specify:

```
detectiscsistorageportcandidate -targetip 192.168.81.91 -srcportid 3 -chapsecret Vardy -site 1
```

You would then specify **lsiscsistorageportcandidate** to list iSCSI port information:

id	src_port_id	target_ipv4	target_ipv6	target_iscsiname	iogroup_list	configured	status
0	4	192.168.213.33		IQN1	1:1:1:1	yes	full

Then establish a session using **addiscsistorageport** for discovery output row 0.

Note: If you specify **-username** or **-chapsecret** with **detectiscsistorageportcandidate** during discovery, you must specify **-username** or **-chapsecret** for session establishment.

```
addiscsistorageport 0
```

The detailed resulting output:

```
No feedback
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

[chnodebootdrive](#)

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

[chnodehw \(SVC\) / chnodecanisterhw \(Storwize family products\)](#)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

[chquorum](#)

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

ls_timezone

Use the **ls_timezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **set_timezone** command to set the time zone.

ls_sasportcandidate

Use the **ls_sasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

ls_security

Use the **ls_security** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

ls_site

Use the **ls_site** command to report the names of the sites.

ls_sra

Use the **ls_sra** command to check both secure remote assistance status and the time of the last login.

ls_throttle

Use the **ls_throttle** command to list throttle objects that are configured in the clustered system.

ls_system

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

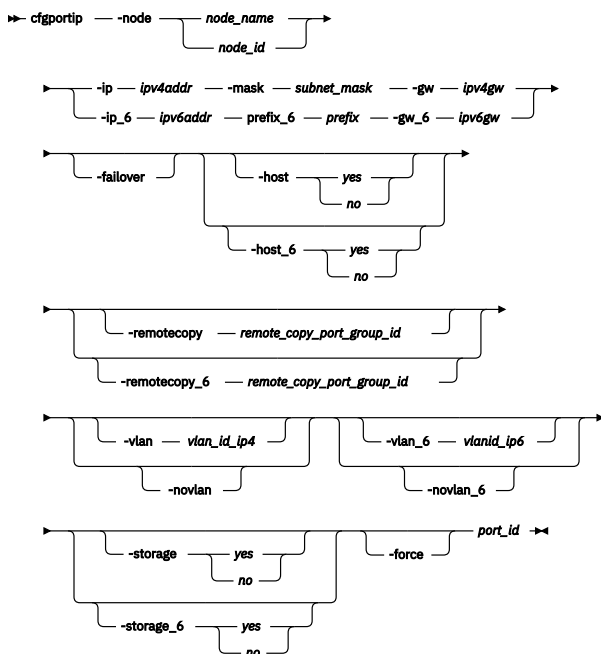

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

cfgportip

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

Syntax

For Internet Protocol Version 4 (IPv4) and Internet Protocol Version 6 (IPv6):

For maximum transmission unit (MTU):

Parameters

-node node_name | node_id

(Required) Specifies which node has the Ethernet port that the IP address is being assigned to.

Note: This parameter is required for setting a port IP address. It cannot be used with the **-mtu** parameter.

-ip *ipv4addr*

(Required) Sets the Internet Protocol Version 4 (IPv4) address for the Ethernet port. You cannot use this parameter with the **ip_6** parameter.

-ip_6 *ipv6addr*

(Required) Sets the Internet Protocol Version 6 (IPv6) address for the Ethernet port. You cannot use this parameter with the **ip** parameter.

-gw *ipv4addr*

(Required) Sets the IPv4 gateway IP address. You cannot use this parameter with the **gw_6** parameter.

-gw_6 *ipv6gw*

(Required) Sets the IPv6 default gateway address for the port. You cannot use this parameter with the **gw** parameter.

-mask *subnet_mask*

(Required) Sets the IPv4 subnet mask. You cannot use this parameter with the **prefix_6** parameter.

-prefix_6 *prefix*

(Required) Sets the IPv6 prefix. You cannot use this parameter with the **mask** parameter.

-failover

(Optional) Specifies that the IP address belongs to the partner node in the I/O group. If the partner node is not configured or offline, the address is configured and presented by this node. When another node comes online in the I/O group, the failover address is presented by that node.

If the partner node is online, do not use this option.

-mtu *mtu* | -defaultmtu

(Required) Specifies the maximum transmission unit (MTU). The default is 1500, with a maximum of 9000. The default for IBM Spectrum Virtualize for Public Cloud on Amazon Web Services (AWS) is 9000. An MTU of 9000 allows you to save CPU utilization for packets of 4 KB and over in size. The increased MTU provides you with improved Internet Small Computer System Interface (iSCSI) performance. Specify **-defaultmtu** to use the default value.

Notes: This parameter has the following restrictions:

- This parameter must be used when you are setting or changing the system MTU value.
- This parameter cannot be used with the **-node** parameter.

-iogrp *iogrp*

(Optional) Specifies the I/O group that contains the nodes to modify.

-host *yes / no*

(Optional) Specifies the IPv4 address that is used for host attach (the existing system settings are retained). Specifying:

- *yes* reports the IPv4 address to hosts during target discovery (default)
- *no* turns off this report (IPv4 addresses are not reported during host discovery).

-remotecopy *remote_copy_port_group_id*

(Optional) Specifies the IPv4 address that is used for the remote copy function. Remote copy includes HyperSwap, Metro Mirror, and Global Mirror. It also specifies the ID for the associated port group. These IDs are numerical values (0, 1, or 2) that specify that IP addresses on a system can be part of a partnership for a login. To form a login, IP addresses must be in the same port group. The default is 0, which indicates that the port is not available for partnerships.

Important: To add or delete ports to or from a replication group, make sure that the partnership that uses that port group is in a stopped state.

-host_6 *yes / no*

(Optional) Specifies the IPv6 address that is used for host attach (the existing system settings are retained). Specifying:

- *yes* reports the IPv6 address to hosts during target discovery (default).

- *no* turns off this report (IPv6 addresses are not reported during host discovery).

Note: Turning off host attach settings for an IP address that is set to yes is disruptive because all host iSCSI sessions to that IP address are logged out.

-remotecopy_6 remote_copy_port_group_id

(Optional) Specifies the IPv6 address that is used for the remote copy function. Remote copy includes HyperSwap, Metro Mirror, and Global Mirror. It also specifies the ID for the associated port group. These IDs are numerical values (0, 1, or 2) that specify that IP addresses on a system can be part of a partnership for a login. To form a login, IP addresses must be in the same port group. The default is 0, which indicates that the port is not available for partnerships.

Important: To add or delete ports to or from a replication group, make sure that the partnership that uses that port group is in a stopped state.

-vlan vlanid_ip4

(Optional) Sets the virtual local area network (VLAN) ID for a IPv4 address that is configured for iSCSI host attach or remote copy function. Remote copy includes HyperSwap, Metro Mirror, and Global Mirror. The VLAN ID for an IPv4 type address can be specified only if the IP address for that port is set. VLAN tagging is disabled for any IP address, so a VLAN ID must be specified by using **-vlan** to turn on VLAN tagging.

Remember: Use **-vlan** with caution. You can:

- Reset VLAN settings, which can disrupt port communication (connection) with hosts or systems (including resetting the VLAN ID for an active iSCSI or IP partnership)
- Reset a VLAN value for a port that does not have VLAN tagging or does not have a configured IP address

The VLAN ID can be set for the failover port that uses the **-failover** attribute.

-novlan

(Optional) Disables VLAN tagging for an IPv4 address for an Ethernet port (which means no VLAN tag is associated with that port).

-vlan_6 vlanid_ip6

(Optional) Sets the virtual local area network (VLAN) ID for a IPv6 address that is configured for iSCSI host attach or remote copy function. Remote copy includes HyperSwap, Metro Mirror, and Global Mirror. The VLAN ID for an IPv6 type address can be specified only if the IP address for that port is set. VLAN tagging is disabled for any IP address, so a VLAN ID must be specified by using **-vlan** to turn on VLAN tagging.

Remember: Use **-vlan_6** with caution:

- Resetting VLAN settings can disrupt port communication (connection) with hosts or systems, including resetting the VLAN ID for an active iSCSI or IP partnership.
- You can reset a VLAN tag for a port that does not have VLAN tagging or does not have a configured IP address.

The VLAN ID can be set for the failover port by using the **-failover** attribute.

-novlan_6

(Optional) Disables Virtual local area network (VLAN) tagging for an IPv6 address for an Ethernet port (which means no VLAN tag is associated with that port).

Remember: Use **-novlan_6** with caution:

- Resetting VLAN settings can disrupt port communication (connection) with hosts or systems, including resetting the VLAN ID for an active iSCSI or IP partnership.
- You can reset a VLAN tag for a port that does not have VLAN tagging or does not have a configured IP address.

-storage yes / no

(Optional) Specifies whether an IPv4 address can be used for the backend storage attach function. The value *yes* indicates that this IPv4 address can be used for iSCSI target discovery and backend

storage connectivity. You must specify *no* (default) if you are not using the storage attach IP address. If the IPv4 address associated with a specific port (on a node) is changed, the existing storage attachment settings are retained. The values are *yes* and *no*.

-storage_6 yes / no

(Optional) Specifies whether an IPv6 address can be used for the backend storage attach function. The value *yes* (the default) indicates that this IPv6 address can be used for iSCSI target discovery and backend storage connectivity. You must specify *no* if you are not using a storage attachment IP address. If the IPv6 address associated with a specific port (on a node) is changed, the existing storage attachment settings are retained. The values are *yes* and *no*.

-force

(Optional) Forces an IP address change for a node Ethernet port even if this causes iSCSI backend controllers being removed or MDisk going into a degraded or offline state.

Important: Use the force attribute rarely to prevent a loss of access to a node or a MDisk.

Changing IP address attributes can cause MDisk to go into a degraded state for some time. If a source IP address is in use for iSCSI backend controller connectivity, changing the IP address or the subnet mask or the IP gateway removes existing sessions and establishes new sessions. During this phase, the MDisk visible through the source port that is reconfigured go to degraded state for a short while until new sessions are established.

You can use the **-force** flag to go ahead with the reconfiguration if you understand all of the risks involved. If you are unsure of what might happen, use the force attribute only under the direction of your support personnel.

If you are adding a new I/O group in the system, you might see message CMMVC8915E. When you configure iSCSI IP addresses on a new I/O group, make sure that you assign the IP address to an unconfigured port and use the **-force** flag for IP assignment.

port_id

(Required) Specifies which port (1, 2, 3, or 4) to apply changes to.

Description

The **cfgportip** command either sets the IP address of an Ethernet port for iSCSI, or configures the MTU of a group of ports. This command assigns either an IPv4 or IPv6 address to a specified Ethernet port of a node. The IP address is used for iSCSI I/O. Use the **chsystemip** command to assign clustered system IP addresses.

Remember: When IP addresses are configured with the same remote replication port group ID (for redundancy) to each node of an I/O group, make sure that the same Ethernet port for both nodes is used during configuration. MTU is set by using symmetric Ethernet ports from the same I/O group. To make sure alternative remote replication port groups work with the same MTU settings, symmetric Ethernet ports must be configured for remote replication port groups.

For an IPv4 address, the **ip**, **mask**, and **gw** parameters are required. All of the IPv4 IP parameters must be specified to assign an IPv4 address to an Ethernet port.

For an IPv6 address, the **ip_6**, **prefix_6**, and **gw_6** parameters are required. All of the IPv6 IP parameters must be specified to assign an IPv6 address to an Ethernet port.

If an IP address is specified for a host, the specified port can be discovered by hosts using the iSNS server (or other discovery mechanisms such as SendTargets). These IP addresses are not reported to partner systems in order to create TCP sessions that are used for remote copy. These ports also cannot be used for login to and SendTargets based discovery of backend iSCSI Storage controllers.

IP addresses that are specified for remote copy cannot be discovered by hosts, which means they cannot be used for host attachment. These ports are not reported to partner systems in order to create TCP sessions for remote copy. These ports also cannot be used to log in to and for SendTargets when considering discovery of backend iSCSI Storage controllers.

After IP configuration, *host_port_group_id* is automatically assigned to the iSCSI ports. Host port grouping groups the ports that have the same speed and ensures that no more than four ports are discovered by a host. Additional *host_port_group_id* criteria include:

- A *host_port_group_id* is an automatic grouping of ports that is designated by an integer. Host port group IDs are unique across I/O groups.
- Each host port group ID contains a maximum of four ports.
- All ports within a host port group ID have identical speeds.
- Identical host port group IDs are assigned to the failover port. If a *host_port_group_id* is already assigned to a failover port, the same *host_port_group_id* are assigned to a local port.
- Enabling `-host` flag to *yes* assigns the *host_port_group_id*. If on a port with host flag *no*, host flag is set to *yes*, resulting in assignment of a *host_port_group_id* to a port.
- Disabling the flag to *no* removes the host port group id associated with a iSCSI port.

IP addresses that are specified for storage cannot be discovered by hosts, which means they cannot be used for host attachment. These IP addresses are not reported to partner systems to create and set up TCP sessions for remote copy.

To use the same IP address for both host I/O and backend storage attach functions (but not for remote copy):

- The **-host** parameter must be set to *yes*.
- The **-storage** parameter must be set to *yes*.
- The **-remotecopy** parameter must be set to *no*.

In these instances, these IP addresses can be discovered by hosts. These IP addresses can also be used for backend storage controller discovery and login for iSCSI based migration and virtualization.

To use the same IP address for both backend storage attach functions and remote copy functions (but not for host I/O operations):

- The **-storage** parameter must be set to *yes*.
- The **-remotecopy** parameter must be specified with the required remote copy port group ID.
- The **-host** parameter must be set to *no*.

In such cases, these IP addresses can be used to discover and connect to backend iSCSI storage controllers. These IP addresses can also be used for IP-based remote copy.

To use the same IP address for both host I/O and remote copy functions (but not for backend storage attach functions):

- The **-host** parameter must be set to *yes*.
- The **-remotecopy** parameter must be invoked with the required remote copy port group ID.
- The **-storage** parameter must be set to *no*.

In such cases, these IP addresses can be discovered by hosts as well as used for IP-based Remote Copy but not for backend storage attach.

Use the **lsportip** command with the optional **ethernet_port_id** parameter to list the port IP addresses for the specified port.

Remember:

If **cfigportip** is used to modify the IP address that is associated with a specific Ethernet port without specifying a new VLAN ID, the new (modified) IP address inherits the existing VLAN ID setting of the earlier IP address (IPv4 or IPv6).

An invocation example for IPv4

```
cfigportip -node 1 -ip 9.8.7.1 -gw 9.0.0.1 -mask 255.255.255.0 1
```

The resulting output:

```
No feedback
```

An invocation example for IPv6

```
cfgportip -node 1 -ip_6 3:3:0:4::0 -gw_6 ffe8::0 -prefix_6 64 2
```

The resulting output:

```
No feedback
```

An invocation example to set an MTU of 1600 on port 1 in I/O group 0

```
cfgportip -mtu 1600 -iogrp 0 1
```

The resulting output:

```
No feedback
```

An invocation example to set the MTU to its default value

```
cfgportip -defaultmtu -iogrp 0 1
```

The resulting output:

```
No feedback
```

An invocation example configuring a new IPv4 address for IP-based replication

```
cfgportip -node 1 -ip 9.8.7.1 -gw 9.0.0.1 -mask 255.255.255.0 -remotecopy 1 -host no -host_6 no 1
```

The resulting output:

```
No feedback
```

An invocation example configuring a new IPv4 address for host attach

```
cfgportip -node 1 -ip 9.8.7.1 -gw 9.0.0.1 -mask 255.255.255.0 -host yes 1
```

The resulting output:

```
No feedback
```

An invocation example configuring replication for an existing IPv6 address

```
cfgportip -node 1 -remotecopy_6 2 1
```

The resulting output:

```
No feedback
```

An invocation example configuring host attach for a new IPv6 address

```
cfgportip -node 1 -ip_6 2001:db8::1:0:0:1 -host_6 yes 1
```

The resulting output:

```
No feedback
```

An invocation example configuring a new IPv4 address with the VLAN ID 105

```
cfgportip -node 1 -ip 9.8.7.1 -gw 9.0.0.1 -mask 255.255.255.0 -vlan 105 1
```

The resulting output:

```
No feedback
```

An invocation example for configuring a new IPv6 address with the VLAN ID 1063

```
cfgportip -node 1 -ip_6 2001:db8::1:0:0:101 -prefix_6 64 -gw_6 2001:db8::1:0:0:1 -vlan_6 1063 1
```

The resulting output:

```
No feedback
```

An invocation example for configuring a new IPv4 address for the backend storage attach function using iSCSI

```
cfgportip -node 1 -ip 9.8.7.1 -gw 9.0.0.1 -mask 255.255.255.0 -storage yes -remotecopy 0 -host no 1  
cfgportip -node 1 -ip 9.8.7.1 -gw 9.0.0.1 -mask 255.255.255.0 -storage yes -host no 1
```

The resulting output:

```
No feedback
```

An invocation example for configuring a new IPv4 address for host attach only

```
cfgportip -node 1 -ip 9.8.7.1 -gw 9.0.0.1 -mask 255.255.255.0 -host yes -storage no 1  
cfgportip -node 1 -ip 9.8.7.1 -gw 9.0.0.1 -mask 255.255.255.0 -host yes -storage no -remotecopy 0 1  
cfgportip -node 1 -ip 9.8.7.1 -gw 9.0.0.1 -mask 255.255.255.0 1
```

The resulting output:

```
No feedback
```

An invocation example for configuring a new IPv4 address for IP-based replication

```
cfgportip -node 1 -ip 9.8.7.1 -gw 9.0.0.1 -mask 255.255.255.0 -storage no -remotecopy 1 -host no 1
```

The resulting output:

```
No feedback
```

An invocation example for configuring the storage attach function for a new IPv6 address

```
cfgportip -node 1 -ip_6 2001:db8::1:0:0:1 -storage_6 yes 1  
cfgportip -node 1 -ip_6 2001:db8::1:0:0:1 1
```

The resulting output:

```
No feedback
```

An invocation example for changing the storage specification for an existing IPv6 address

```
cfgportip -node 1 -storage_6 no 1
cfgportip -node 1 -storage_6 yes 1
```

The resulting output:

```
No feedback
```

Related reference

[addnode](#) (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster](#) (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

[chnodebootdrive](#)

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

[chnodehw](#) (SVC) / [chnodecanisterhw](#) (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

[chquorum](#)

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

ls_timezone

Use the **ls_timezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **set_timezone** command to set the time zone.

ls_sasportcandidate

Use the **ls_sasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

ls_security

Use the **ls_security** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

ls_site

Use the **ls_site** command to report the names of the sites.

ls_sra

Use the **ls_sra** command to check both secure remote assistance status and the time of the last login.

ls_throttle

Use the **ls_throttle** command to list throttle objects that are configured in the clustered system.

ls_system

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

Syntax

➔ **chbanner** 

Parameters

-file *file_path*

(Optional) Specifies the path to the file on the configuration node that contains the new login message.

-enable

(Optional) Enables the login message.

-disable

(Optional) Disables the login message.

-clear

(Optional) Clears the login message.

Description

This command configures the login message that is displayed during CLI SSH login. Use this command for warnings or disclaimers or anything else you need to display in your login screen before logging in.

The file that contains the login message must be copied to the configuration node before you specify **chbanner -file**. If a configuration node failover occurs between copying the file that contains the login message and running the command, the temporary file must be copied to the new configuration node.

To set a login message that uses a SAN administrator's workstation:

1. Use a suitable text editor to create the message and save the file with a recognizable name.
2. Use a secure copy client to copy the file to the configuration node of the system to be configured.
3. Specify the management IP address of the system that is to be configured.
4. Log into the system to be configured.
5. Use the **chbanner** command to set the login message.

An invocation example

```
chbanner -file /tmp/loginmessage
```

The detailed resulting output:

```
No feedback
```

An invocation example

```
chbanner -enable
```

The detailed resulting output:

```
No feedback
```

An invocation example

```
chbanner -disable
```

The detailed resulting output:

```
No feedback
```

An invocation example

```
chbanner -clear
```

The detailed resulting output:

```
No feedback
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

Syntax

➤ **chportib** — **-ip** — *ipv4addr* — **-mask** — *subnet_mask* — **-gw** — *ipv4gw* — *object_id* ➤

Parameters

-ip *ipv4addr*

(Required) Sets the IPv4 address for the Ethernet port. You cannot use this parameter for IPv6 addresses.

-mask *subnet_mask*

(Required) Sets the IPv4 subnet mask. You cannot use this parameter with the IPv6 subnet masks.

-gw *ipv4gw*

(Required) Sets the IPv4 gateway IP address. You cannot use this parameter for IPv6 gateway addresses.

object_id

(Required) Specifies which port (1, 2, 3, or 4) to apply changes to. The default is 1.

Description

This command assigns an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports

An invocation example for IPv4

```
chportib -ip 9.8.7.1 -gw 9.0.0.1 -mask 255.255.255.0 1
```

The resulting output

```
No feedback
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

[chnodebootdrive](#)

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

[chnodehw \(SVC\) / chnodecanisterhw \(Storwize family products\)](#)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

[chquorum](#)

Use the **chquorum** command to change the quorum association.

[chsecurity](#)

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

[chsite](#)

Use the **chsite** command to change the site name.

[chsra](#)

Use the **chsra** command to configure support assistance.

[chsystem](#)

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

[chsystemcert](#)

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

[chsystemip](#)

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

[chsystemethernet](#)

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

[chthrottle](#)

Use the **chthrottle** command to change attributes associated with a specified throttle object.

[cleardumps](#)

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

[cpdumps](#)

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

[detectiscsistorageportcandidate](#)

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

[dumpconfig](#) (Discontinued)

Attention: The **dumpconfig** command is discontinued.

[help](#)

Use the **help** (or **man**) command to display help information for system commands.

[lsclustercandidate](#) (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

[lscluster](#) (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

[lsclusterip](#) (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

[lsclusterstats](#) (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lscsiportauth

Use the **lscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lscsisstorageport

Use the **lscsisstorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lscsisstorageportcandidate

Use the **lscsisstorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/ **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

ls_timezone

Use the **ls_timezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **set_timezone** command to set the time zone.

ls_sasportcandidate

Use the **ls_sasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

ls_security

Use the **ls_security** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

ls_site

Use the **ls_site** command to report the names of the sites.

ls_sra

Use the **ls_sra** command to check both secure remote assistance status and the time of the last login.

ls_throttle

Use the **ls_throttle** command to list throttle objects that are configured in the clustered system.

ls_system

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

Related reference

addnode (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

addiscsistorageport

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

cfgportip

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrpghost

Use the **lsiogrpghost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

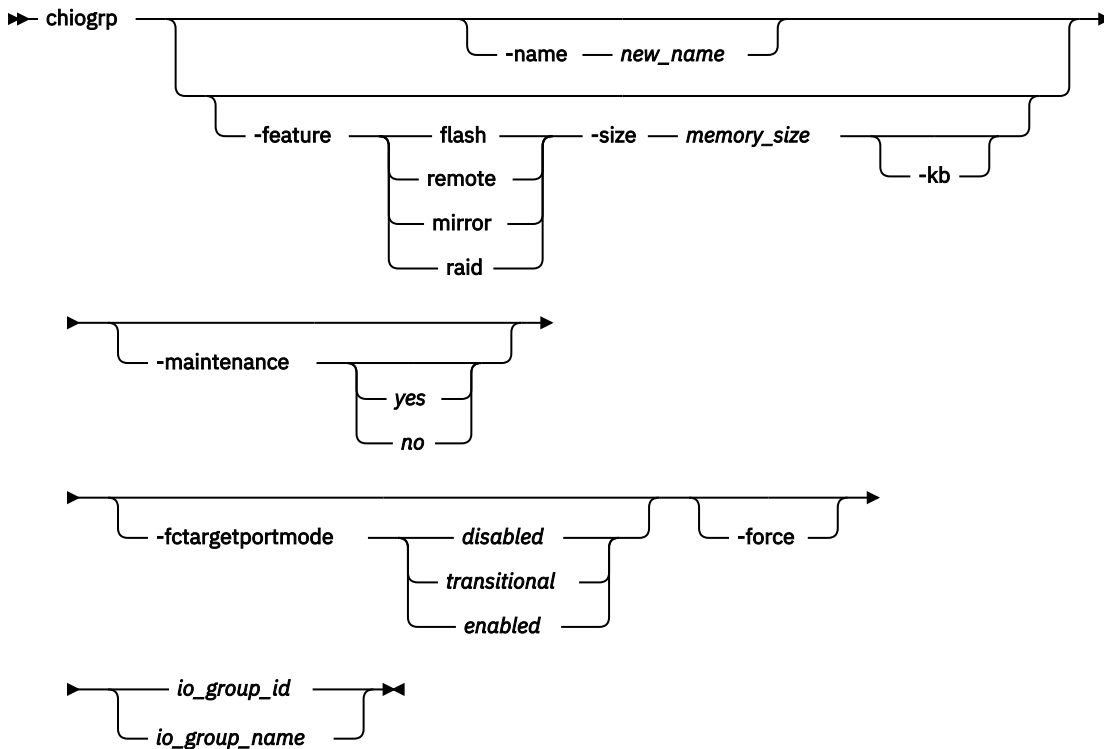

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

Syntax

Parameters

-name *new_name*

(Optional) Specifies the name to assign to the I/O group. The **-name** parameter cannot be specified with the **-feature**, **-size**, or **-kb** parameters.

-feature *flash | remote | mirror | raid*

(Optional) Specifies the feature to modify the amount of memory for RAID arrays, Copy Services, or volume mirroring. You must specify this parameter with the **-size** parameter. You cannot specify this parameter with the **-name** parameter.

- **flash** specifies the amount of memory that is used for FlashCopy.
- **remote** specifies the amount of memory that is used for remote copy processing. Remote copy includes Metro Mirror, Global Mirror, and HyperSwap.
- **mirror** specifies the amount of memory that is used for volume mirroring operations.
- **raid** specifies the amount of memory that is used for RAID arrays.

Note: Specifying **remote** changes the amount of memory that is available for remote copy processing. Any volume that is in a remote copy relationship uses memory in its I/O group, including master and auxiliary volumes, and volumes that are in inter-system or intra-system relationships.

-size *memory_size*

(Optional) Specifies the amount of memory that is available for the specified RAID arrays, Copy Services, or volume mirroring function. Valid input is 0 or any integer. The default unit of measurement for this parameter is megabytes (MB); you can use the kilobytes **-kb** parameter to override the default. You must specify this parameter with the **-feature** parameter. You cannot specify this parameter with the **-name** parameter.

-kb

(Optional) Changes the units for the **-size** parameter from megabytes (MB) to kilobytes (KB). If you specify this parameter, the **-size *memory_size*** value must be any number divisible by 4. You must specify this parameter with the **-feature** and **-size** parameters. You cannot specify this parameter with the **-name** parameter.

-maintenance *yes | no*

(Optional) Specifies whether the I/O group must be in maintenance mode. The I/O group must be placed in maintenance mode while performing service procedures on storage enclosures. After you enter maintenance mode, it continues until either:

- It is explicitly cleared.
- Thirty minutes elapse.

Note: Changing the maintenance mode on any I/O group changes the maintenance mode on all I/O groups.

-fctargetportmode *disabled | transitional | enabled*

(Optional) Specifies the Fibre Channel (FC) host port mode of the I/O group. The values are *disabled*, *transitional*, or *enabled*. The *transitional* state is an intermediate state where both the virtual ports and physical ports are enabled.

Note: NVMe over Fibre Channel is not supported in the *disabled* state and on some Fibre Channel adapters and platforms.

-force

(Optional) Specifies that an FC host port be disabled or enabled, even if disruption to host I/O might occur as a result. You can only specify **-force** with **-fctargetportmode**.

Important: Specifying **-force** might result in a loss of access. Use it only under the direction of your product support information.

io_group_id | io_group_name

(Required) Specifies the I/O group to modify. You can modify an I/O group by using the **-name** or the **-feature** parameter.

Description

The **chiogrp** command modifies the name of an I/O group or the amount of memory that is available for RAID arrays, Copy Services, or volume mirroring.

Use the **-feature** and **-size** parameters (together) to change the amount of memory available in the I/O group to one of the following types:

- FlashCopy
- Volume mirroring
- RAID
- Remote copy, including Metro Mirror, Global Mirror, and HyperSwap.

For example:

```
chiogrp -feature flash -size 40 0
```

You can assign a name to an I/O group or change the name of a specified I/O group. You can change the amount of memory that is available for RAID arrays, Copy Services, or volume mirroring operations by specifying the **-feature flash | remote | mirror** parameter - and a memory size. For volume mirroring and Copy Services (FlashCopy, Metro Mirror, Global Mirror, and HyperSwap), memory is traded against memory that is available to the cache.

The amount of memory can be decreased or increased. Consider the following memory sizes when you use this command:

- The default amount of memory for FlashCopy is 20 MB.
- The default amount of memory for remote copy (which includes Metro Mirror, Global Mirror, and HyperSwap) is 20 MB.
- The default memory size for mirrored volumes is 20 MB.
- The default memory size for RAID arrays is 40 MB.
- The maximum amount of memory that can be specified for FlashCopy is 512 MB. For 64-bit systems, the maximum is 2048 MB.
- The maximum amount of memory for remote copy (which includes Metro Mirror, Global Mirror, and HyperSwap) is 512 MB.
- The maximum memory size that can be specified for mirrored volumes is 512 MB.
- The maximum memory size for RAID arrays is 512 MB.

The maximum combined amount of memory across all features is 552 MB.

Note: For 64-bit systems, the maximum is 2600 MB. Some systems that are running 64-bit mode might have 2 GB of bitmap space to use for FlashCopy, which is enough for 4 PB of data space to be used per I/O group. For example, Metro Mirror, Global Mirror, Volume Mirroring, and RAID share 552 MB of bitmap space, which is enough to use 1080 PB of data space per I/O group. Older systems, such as those running 32-bit code, might be subject to a 740 MB limit.

This table demonstrates the amount of memory that is required for copy services and volume mirroring. For the listed grain size, each 1 MB of memory provides the indicated volume capacities.

Table 30. Memory that is required for copy services and volume mirroring		
Feature	Grain size	1 MB of memory provides the following volume capacity for the specified I/O group
Metro Mirror and Global Mirror	256 KB	2 TB of total Metro Mirror and Global Mirror volume capacity

Table 30. Memory that is required for copy services and volume mirroring (continued)

Feature	Grain size	1 MB of memory provides the following volume capacity for the specified I/O group
HyperSwap	256 KB	2 TB of total HyperSwap volume capacity Note: For 2 TB of HyperSwap volume capacity, 1 MB must be assigned in each caching I/O group.
FlashCopy	256 KB	2 TB of total FlashCopy source volume capacity
FlashCopy	64 KB	512 GB of total FlashCopy source volume capacity
Incremental FlashCopy	256 KB	1 TB of total Incremental FlashCopy source volume capacity
Incremental FlashCopy	64 KB	256 GB of total Incremental FlashCopy source volume capacity
Volume mirroring	256 KB	2 TB of mirrored volumes

Table 31 on page 252 provides the approximate memory cost for each array in an I/O group, where MS is the size of each member drive and MC is the number of member drives in the array. For multiple arrays in an I/O group, adding the costs together to get the RAID feature size for the I/O group.

Table 31. RAID level bitmap memory costs

Level	Member count	Approximate capacity	Redundancy	Approximate bitmap memory cost
RAID-0	1-8	MC * MS	None	(1 MB per 2 TB of MS) * MC
RAID-1	2	MS	1	(1 MB per 2 TB of MS) * (MC/2)
RAID-5	3-16	(MC-1) * MS	1	1 MB per 2 TB of MS with a strip size of 256 KB; double with strip size of 128 KB.
RAID-6	5-16	less than (MC-2 * MS)	2	
RAID-10	2-16 (evens)	MC/2 * MS	1	(1 MB per 2 TB of MS) * (MC/2)

Note: There is a margin of error on the approximate bitmap memory cost of approximately 15%. For example, the cost for a 256 KB strip size for RAID-5 is ~1.15 MB for the first 2 TB of MS.

For multiple FlashCopy targets, you must consider the number of mappings. For example, for a mapping with a 256 KB grain size, 8 KB of memory allows one mapping between a 16 GB source volume and a 16 GB target volume. Alternatively, for a mapping with a 256 KB grain size, 8 KB of memory allows two mappings between one 8 GB source volume and two 8 GB target volumes.

After you create a FlashCopy mapping, if you specify an I/O group other than the I/O group of the source volume, the memory accounting goes towards the specified I/O group, not towards the I/O group of the source volume.

Scenario 1

If the I/O group contains:

- At least one 8 GB node.
- At least one thin-provisioned or compressed volume in a data reduction pool.
- A FlashCopy bitmap size for that I/O group set beyond 1.5 GB.

The command fails due to insufficient resources available.

An invocation example to create a new I/O group `testiogrpone`

```
chiogrp -name testiogrpone io_grp0
```

The resulting output:

```
No feedback
```

An invocation example for changing the amount of FlashCopy memory in `io_grp0` to 30 MB

```
chiogrp -feature flash -size 30 io_grp0
```

The resulting output:

```
No feedback
```

An invocation example for changing the amount of RAID memory in I/O group 0 to 512 MB

```
chiogrp -feature raid -size 512 0
```

The resulting output:

```
No feedback
```

Use the **chsra** command to configure support assistance.

[chsystem](#)

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

[chsystemcert](#)

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

[chsystemip](#)

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

[chsystemethernet](#)

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

[chthrottle](#)

Use the **chthrottle** command to change attributes associated with a specified throttle object.

[cleardumps](#)

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

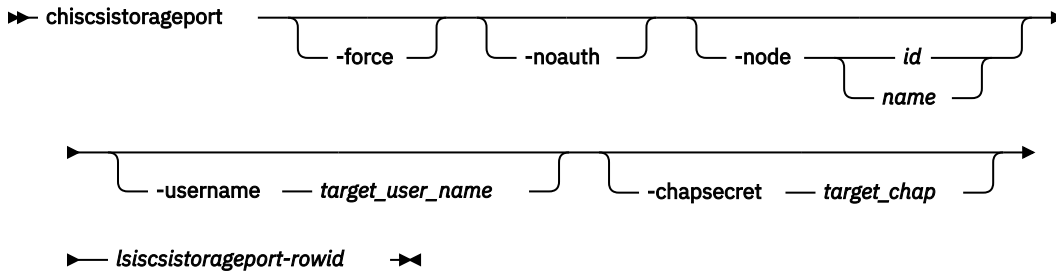

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

Syntax

Parameters

-force

(Optional - Spectrum Virtualize for Public Cloud only) When used, specify **-force** only with the **-noauth** parameter to force the clearance of authentication credentials for all initiator nodes in a single command.

-noauth

(Optional) Clears all authentication parameters for a session. For IBM Spectrum Virtualize for Public Cloud only, specify **-node** with **-noauth** to clear the credentials per initiator node. If **-node** is not specified, **-noauth** requires **-force** to clear the credentials for all initiator nodes.

Note: The **-noauth** parameter cannot be used with other parameters. IBM Spectrum Virtualize for Public Cloud is an exception. You must specify **-noauth** with **-force** to clear authentication for all initiator nodes, or with **-node** to clear authentication per initiator node, but not with other parameters.

-node id / name

(Optional - Spectrum Virtualize for Public Cloud only) Specifies the ID or name of a node in the system. The value must be an alphanumeric string.

-username target_user_name

(Optional) Specifies the target controller user name. The value must be an alphanumeric string up to 256 characters. For IBM Spectrum Virtualize for Public Cloud only, when **-node** is specified, the value of **-username** must be an alphanumeric string up to 32 characters. Otherwise, the value of **-username** must be an alphanumeric string up to 256 characters.

If the target controller requires a *target_user_name* and *target_chap* for discovery, the user name for the target controller must be specified.

Warning: Changing the **-username** for a target controller can be a disruptive operation, so exercise caution when you change the authentication details for the session. Be sure to make the controller side authentication credentials changes before you change the authentication credentials for the session.

Some controllers might require that you use the iSCSI qualified name (IQN) user name for discovery. The IQN of each node is picked up automatically and used if required.

-chapsecret target_chap

(Optional) Specifies the Challenge-Handshake Authentication Protocol (CHAP) secret *target_chap* required for discovery of the target iSCSI controller. The value must be an alphanumeric string up to 80 characters. For IBM Spectrum Virtualize for Public Cloud only, when you specify **-node**, the value

of **-chapsecret** must be an alphanumeric string up to 32 characters. Otherwise, the value of **-chapsecret** must be an alphanumeric string up to 80 characters. This keyword is required when not using the **-noauth** parameter.

Warning: Changing the **-chapsecret** for a target controller can be a disruptive operation, so exercise caution when you change the authentication details for the session. Be sure to make the controller side authentication credentials changes before you change the authentication credentials for the session.

lsiscsistorageport-rowid

(Required) Specifies the row ID of an existing **lsiscsistorageport** output row.

Description

The **chiscsistorageport** command operates on a row ID specified by the output of **lsiscsistorageport** command. Because some storage controllers do not drop the existing active session after you change the authentication credentials, this command forces the session to drop and reconnect to confirm that the changed authentication credentials work.

Note: You cannot change the session mode between target-specific authentication and initiator node-specific authentication by using this command.

An invocation example to clear authentication for an iSCSI session

This example shows how to clear the authentication details of a session. For example, first specify **lsiscsistorageport** to list iSCSI port information:

```
lsiscsistorageport
id   port_id target_ipv4 target_ipv6 target_iscsiname controller_id controller_name
iogroup_list status site_id site_name
5     2      10.10.10.1          IQN1             1             ctrlr1
1:1:1:1      full
```

The following example shows how to clear authentication where the target has a single user name or CHAP secret. This example applies to all products except for the IBM Spectrum Virtualize for Public Cloud product.

```
chiscsistorageport -noauth 5
```

The result is clearing the authentication of iSCSI sessions from all initiator nodes.

For IBM Spectrum Virtualize for Public Cloud only, the following example uses the **-force** parameter to show how to clear authentication where the target has a user name or CHAP secret per initiator node.

```
chiscsistorageport -force -noauth 5
```

The result is clearing the authentication of iSCSI sessions from all initiator nodes.

For IBM Spectrum Virtualize for Public Cloud only, to clear credentials for a specific node, specify **-node** with **-noauth**. To clear credentials for all nodes, specify **-force** instead of **-node** with **-noauth**.

An invocation example to change an existing user name

The following example shows how to change an existing user name where the target has a single user name or CHAP secret. The **-username** parameter requires the **-chapsecret** parameter. This example applies to all products except for the IBM Spectrum Virtualize for Public Cloud product.

```
chiscsistorageport -username superman -chapsecret abcd 5
```

The result is changing the authentication of iSCSI sessions from all initiator nodes.

For IBM Spectrum Virtualize for Public Cloud only, the following example shows how to change an existing user name where the target has a user name or CHAP secret per initiator node (node1 in this example).

```
chiscsistorageport -username superman -chapsecret batman -node node1 5
```

The result is changing the authentication of iSCSI sessions from initiator node node1.

An invocation example to change an existing CHAP secret

The following example shows how to change an existing **-chapsecret** where the target has a single user name or CHAP secret. This example applies to all products except the IBM Spectrum Virtualize for Public Cloud product.

```
chiscsistorageport -chapsecret batman 5
```

The result is changing the authentication of iSCSI sessions from all initiator nodes.

For IBM Spectrum Virtualize for Public Cloud only, specify the node name to change an existing chapsecret where the target has a user name or CHAP secret per initiator node (node1 in this example).

```
chiscsistorageport -chapsecret batman -node node1 5
```

The result is changing the authentication of iSCSI sessions from initiator node node1.

An invocation example to change an existing user name and CHAP secret

This example shows how to change an existing **-username** and **-chapsecret** where the target has a single user name or CHAP secret. This example applies to all products except the IBM Spectrum Virtualize for Public Cloud product.

```
chiscsistorageport -username superman -chapsecret batman 5
```

The result is changing authentication of iSCSI sessions from all initiator nodes.

For IBM Spectrum Virtualize for Public Cloud only, specify the **-node** parameter to change an existing **-username** and **-chapsecret** where the target has a user name or CHAP secret per initiator node.

```
chiscsistorageport -username superman -chapsecret batman -node node1 5
```

The result is changing the authentication of iSCSI sessions from initiator node node1.

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster](#) (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

[chnodebootdrive](#)

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

[chnodehw](#) (SVC) / [chnodecanisterhw](#) (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

[chquorum](#)

Use the **chquorum** command to change the quorum association.

[chsecurity](#)

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

[chsite](#)

Use the **chsite** command to change the site name.

[chsra](#)

Use the **chsra** command to configure support assistance.

[chsystem](#)

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

[chsystemcert](#)

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

[chsystemip](#)

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

[chsystemethernet](#)

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

[chthrottle](#)

Use the **chthrottle** command to change attributes associated with a specified throttle object.

[cleardumps](#)

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

Syntax

```
➤ chiscsiportauth -src_ip ip_address -iqn iqn -username user_name  
                  -src_port_id id -node id / name -chapsecret chapsecret ➤
```

Parameters

-src_ip ip_address

(Required if you do not specify **-src_port_id** and **-node**) The IPv4 or IPv6 address of the system initiator port for which the credentials are configured. You cannot specify this value with **-src_port_id** or **-node**.

-src_port_id id

(Required if you do not specify **-src_ip**) The source port identifier of the initiator port for which the credentials are configured. This value is the numeric ID of the Ethernet port starting with 1 up to the maximum ports in the system. You cannot specify this value with **-src_ip**, and you must specify this value with **-node**.

-node id / name

(Required if you do not specify **-src_ip**) Specify the node ID or name for which the credentials are configured. You cannot specify this value with **-src_ip**, and you must specify this value with **-src_port_id**.

-iqn iqn

(Required) The iSCSI Qualified name (IQN) used to connect to the target storage. This value is an alphanumeric with a maximum of 256 characters.

-username user_name

(Required) The username used to authenticate to the target storage. This value is an alphanumeric with a maximum of 32 characters.

-chapsecret chap_secret

(Required) The chapsecret used to authenticate to the target storage. This value is an alphanumeric with a maximum of 32 characters.

Description

This command is used to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. Before you run this command, the system authentication must be set to *ip* with the `svctask chsystem -force ip` command.

An invocation example

```
svctask chiscsiportauth -src_ip 192.168.4.21 -iqn iqn.1986.ibm.com:cluster1.node1 -username  
marvel -chapsecret phantom
```

The resulting output:

No feedback

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

[chnodebootdrive](#)

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

[chnodehw \(SVC\) / chnodecanisterhw \(Storwize family products\)](#)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

[chquorum](#)

Use the **chquorum** command to change the quorum association.

[chsecurity](#)

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

[chsite](#)

Use the **chsite** command to change the site name.

[chstra](#)

Use the **chstra** command to configure support assistance.

[chsystem](#)

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional.

However, you must specify one or more parameters with this command.

[chsystemcert](#)

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

[chsystemip](#)

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

[chsystemethernet](#)

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

[chthrottle](#)

Use the **chthrottle** command to change attributes associated with a specified throttle object.

[cleardumps](#)

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

[cpdumps](#)

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

[detectiscsistorageportcandidate](#)

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

[dumpconfig](#) (Discontinued)

Attention: The **dumpconfig** command is discontinued.

[help](#)

Use the **help** (or **man**) command to display help information for system commands.

[lsclustercandidate](#) (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

[lscluster](#) (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

[lsclusterip](#) (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

[lsclusterstats](#) (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

[lsdiscoverystatus](#)

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

[lsfabric](#)

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

[lsnvmefabric](#)

Use the **lsnvme**fabric**** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lscsiportauth

Use the **lscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lscsisstorageport

Use the **lscsisstorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lscsisstorageportcandidate

Use the **lscsisstorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

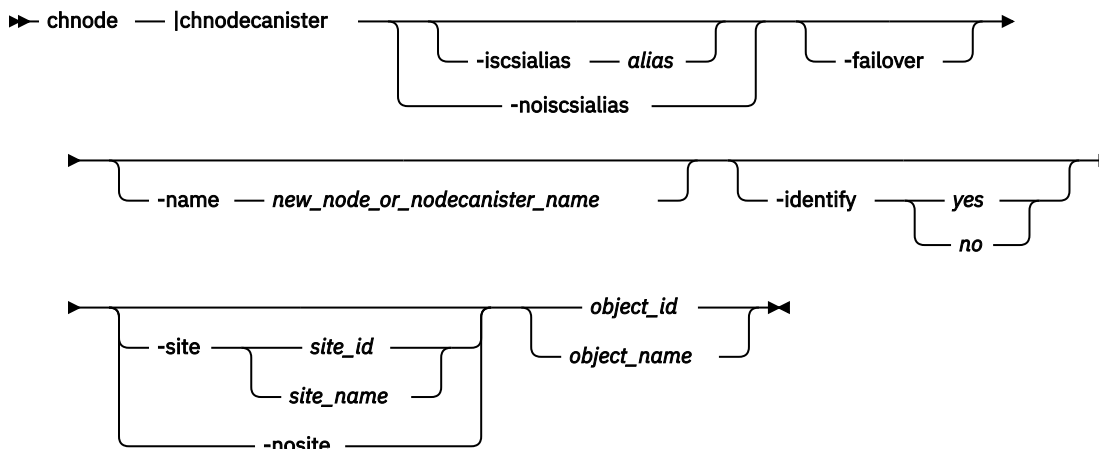

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

Syntax

Parameters

-iscsialias alias

(Optional) Specifies the iSCSI name of the node or node canister. The maximum length is 79 characters. Do not use spaces for the iSCSI alias name.

Important: You can specify this parameter for online spares nodes.

-noiscsialias

(Optional) Clears any previously set iSCSI name for this node or node canister. This parameter cannot be specified with the **iscsialias** parameter.

Important: You can specify this parameter for online spares nodes.

-failover

(Optional) Specifies that the name or iSCSI alias being set is the name or alias of the partner node or node canister in the I/O group. When there is no partner node or node canister, the values set are applied to the partner node or node canister when it is added to the system. If this parameter is used when there is a partner node or node canister, the name or alias of that node or node canister changes.

Important: You can specify this parameter for online spares nodes.

-name new_node_or_nodecanister_name

(Optional) Specifies the name to assign to the node or node canister.

Note: Node or node canister names supplied with `-name` on **chnode** / **chnodecanister** commands must not be in use already as node or node canister names or as node or node canister failover names.

Important: The iSCSI Qualified Name (IQN) for each node or node canister is generated using the clustered system and node or node canister names. If you are using the iSCSI protocol, changing either name also changes the IQN of all of the nodes or node canisters in the clustered system and might require reconfiguration of all iSCSI-attached hosts.

-identify yes / no

(Optional) Allows you to control the light-emitting diode (LED) used on the node. The values are *yes* or *no*.

Important: You can specify this parameter for online spares nodes.

-site site_id / site_name

(Optional) Specifies the numeric site value or site name for the existing node. The value is 1 or 2.

Note: The site assigned to the node cannot be changed if the system topology is HyperSwap or stretched.

-nosite

(Optional) Resets the site value.

object_id / object_name

(Required) Specifies the object name or ID that you want to modify. The variable that follows the parameter is either:

- The object name that you assigned when you added the node to the clustered system
- The object ID that is assigned to the node (not the worldwide node name)

Description

If the **failover** parameter is not specified, this command changes the name or iSCSI alias of the node or node canister. The name can then be used to identify the node or node canister in subsequent commands.

The **failover** parameter is used to specify values that are normally applied to the partner node or node canister in the I/O group. When the partner node or node canister is offline, the iSCSI alias and IQN are assigned to the remaining node or node canister in the I/O Group. The iSCSI host data access is then preserved. If the partner node or node canister is offline when these parameters are set, the node or node canister they are set on handles iSCSI I/O requests to the iSCSI alias specified, or the IQN that is created using the node or node canister name. If the partner node or node canister in the I/O group is online when these parameters are set, the partner node or node canister handles iSCSI requests to the iSCSI alias specified, and its node or node canister name and IQN change.

To change the name of the node (with I/O running) :

1. Make sure the host system has active sessions with both node canisters in the I/O group (hosting the volume on which the I/O occurs).
2. Change name of one node canister using **chnode** command.
3. From the host system, log out of the node canister whose name changes.
4. Rediscover the target iSCSI qualified name (IQN) from the host using the host operating system's discovery mechanism.
5. Login with the new target IQN discovered on the host system, and make sure the login succeeds.
6. Repeat steps 2-5 with the other node canister.

Note: When using VMware ESX, delete the static paths (in the iSCSI initiator properties) that contain the old target IQN.

This ensures that the node canister name change does not impact iSCSI I/O during events such as a target failover.

An invocation example

```
chnode -name newname -identify yes node8
```

The resulting output:

```
No feedback
```

An invocation example

```
chnode -name testnodeone nodeone
```

The resulting output:

```
No feedback
```

An invocation example

```
chnodecanister -name testnodeone nodeone
```

The resulting output:

```
No feedback
```

An invocation example

```
chnode -site 1 node2
```

The resulting output:

```
No feedback
```

An invocation example

```
chnodecanister -site 1 node2
```

The resulting output:

```
No feedback
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

Syntax

Parameters

-identify

(Optional) Allows you to control the light-emitting diode (LED).

-battery *battery_id*

(Optional) Specifies the battery that is in the node.

-remove

(Optional) Specifies battery removal and terminates any calibration that runs on another battery.

node

(Optional) Specifies the node that the battery is in.

Description

This command notifies the battery back-up (BBU) driver that a user wants to remove a battery.

An invocation example to make the fault LED flash on battery 1 in node 3

```
chnodebattery -identify yes -battery 1 3
```

The resulting output:

```
No feedback
```

An invocation example to remove battery 1 in node 3

```
chnodebattery -remove -battery 1 3
```

The resulting output:

```
No feedback
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsstorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

cfgportip

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsscsistorageportcandidate

Use the **lsscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/ **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister.

Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

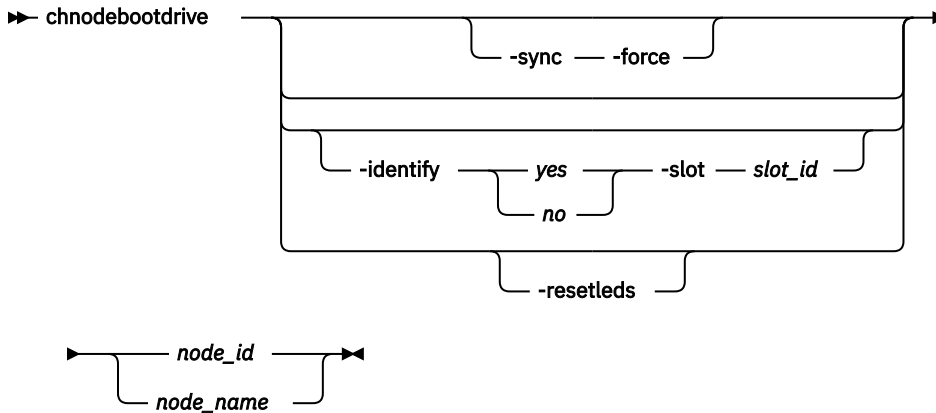

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

Syntax

Parameters

-sync

(Optional) Specifies synchronization of drives marked can_sync.

-force

(Optional) Forces synchronization (though taking the node offline might cause a volume to go offline).

Important: Using the force parameter might result in a loss of access. Use it only under the direction of IBM support personnel.

-identify yes / no

(Optional) Controls the operation of the light-emitting diode (LED) of the drive in the specified slot.

-slot slot_id

(Optional) Specifies the boot drive slot. It must be used with the **-identify** parameter.

resetleds

(Optional) Clears the identify LEDs of all drives in the specified node and indicates **-identify no** is specified.

node_id / node_name

(Optional) Specifies the ID or name of the node.

Description

The command identifies and synchronizes drive information for system drives.

Specifying **-sync** causes a node restart on the specified node. This restart is not successful if any volume depends on that node.

Important: If **-force** is also specified, the system does not check for dependent volumes.

An invocation example

```
chnodebootdrive
```

The following output is displayed:

```
No feedback
```

An invocation example

```
chnodebootdrive -identify yes -slot 1 1
```

The following output is displayed:

```
No feedback
```

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/ **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

ls_timezone

Use the **ls_timezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **set_timezone** command to set the time zone.

ls_sasportcandidate

Use the **ls_sasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

ls_security

Use the **ls_security** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

ls_site

Use the **ls_site** command to report the names of the sites.

ls_ra

Use the **ls_ra** command to check both secure remote assistance status and the time of the last login.

ls_throttle

Use the **ls_throttle** command to list throttle objects that are configured in the clustered system.

ls_system

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

Syntax

Parameters

-legacy version

(Optional) Sets the hardware configuration to make it compatible with the 6.3.0.0 code level. The format is four decimal numbers that are separated by periods, and there can be up to 16 characters.

-force

(Optional) Allow the node to restart and change its hardware configuration even if it causes volumes to go offline.

Important: Using the force parameter might result in a loss of access. Use it only under the direction of IBM support personnel.

object_id / object_name

(Optional) Specifies the object name or ID.

Description

This command automatically reboots the node or node canister if the node or node canister hardware is different than its configured hardware. After rebooting, the node or node canister uses its hardware, and does not use the previous configuration.

Attention: When you run the **chnodehw** command to change the configured hardware for a node:

- Small Computer System Interface-3 (SCSI-3) reservations (through that node) are removed.
- Small Computer System Interface-3 (SCSI-3) registrations (through that node) are removed.

Note: This command fails if you remove the last compression card of a node and try to commit that change while compressed volumes still exist in that I/O group.

Use the **-legacy** parameter if you want to establish a partnership with another clustered system that is running an earlier level of code than the local system. The value that is supplied for the **-legacy** parameter must be the code level of the other clustered system.

An invocation example of how to update the node hardware configuration of node ID 7

```
chnodehw 7
```

The resulting output:

```
No feedback
```

An invocation example of how to update the node hardware configuration for the node named node7 (including if the node reboot causes an I/O outage)

```
chnodehw -force node7
```

The resulting output:

```
No feedback
```

An invocation example of how to update the node hardware configuration for compatibility with code level 6.3.0.0

```
chnodehw -legacy 6.3.0.0 node2
```

The resulting output:

```
No feedback
```

An invocation example of how to update the node canister hardware configuration of canister ID 7

```
chnodecanisterhw 7
```

The resulting output:

```
No feedback
```

An invocation example of how to update the node canister hardware configuration for canister7 (including if the canister reboot causes an I/O outage)

```
chnodecanisterhw -force canister7
```

The resulting output:

```
No feedback
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

cfgportip

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrpghost

Use the **lsiogrpghost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/ **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister.

Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

ls_timezones

Use the **ls_timezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **set_timezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

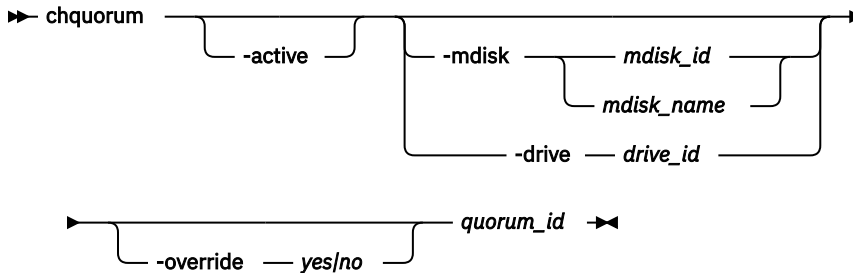

swapnode

Use the **swaponode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

chquorum

Use the **chquorum** command to change the quorum association.

Syntax

Parameters

-active

(Optional) Makes the specified quorum ID the active one. The **active** parameter must be used if neither the **mdisk** nor the **drive** parameters are specified.

-mdisk *mdisk_id* | *mdisk_name* | -drive *drive_id*

(Optional) Specifies the MDisk or drive to be this quorum ID.

Note: SAN Volume Controller systems use MDisk only.

-override *yes/no*

Enables the automatic quorum selection to be overridden. In this state, the quorum disk is only moved if the resources are offline. Do not use this parameter unless a specific quorum disk is required for the configuration.

quorum_id

(Required) Specifies which quorum ID to change. Permitted values are values are 0, 1, and 2.

Description

Use the **chquorum** command to change the quorum association. To identify the drive or MDisk that is the current active quorum disk, use the **lsquorum** command.

Remember: You cannot use this command to change the active quorum device when you use an IP quorum application. To change the active IP quorum application, the quorum application must be restarted. The quorum application that connects first is chosen and is active (if valid).

The **chquorum** command is not synchronous, but usually takes only a few seconds to complete. In some situations it can take several minutes.

The system uses the quorum disk or drive as a tie breaker when exactly half of the nodes that were previously a member of the system are present.

Attention: Only assign quorum disks to drives in the control enclosure or to external MDisk. Some maintenance procedures require that quorum is moved temporarily to expansion enclosures. Once that procedure is complete, return the quorum drives to the control enclosure.

The use of a quorum disk or drive allows the system to manage a SAN fault that splits the system exactly in half. One half of the system continues to operate and the other half stops until SAN connectivity is restored.

There is only one quorum disk or drive; however, the system uses three as quorum candidates. The system selects the actual quorum disk or drive from the pool of quorum candidates. The quorum

candidates also hold a copy of important system metadata. Just over 256 MB is reserved for this purpose on each quorum candidate disk. When using an MDisk as quorum disk, this space is allocated from the storage pool.

The number of extents required depends on the extent size for the storage pool containing the MDisk. This table provides the number of extents reserved for quorum use by extent size.

Table 32. Number of extents reserved by extent size	
Extent size (MB)	Number of extents reserved for quorum use
16	17
32	9
64	5
128	3
256	2
512	1
1024	1
2048	1
4096	1
8192	1

When you issue this command, the MDisk or drive that currently is assigned the quorum index number is set to a nonquorum disk. The system automatically assigns quorum indexes.

You can set the active quorum disk or drive with the **-active** parameter. This can be useful in a system configuration to ensure that the most highly-available quorum disk or drive is used.

Note: Quorum disks must be allocated one per site when the system topology is stretched or hyperswap.

An invocation example

```
chquorum -mdisk 45 2
```

The resulting output:

```
No feedback
```

[addnode](#) (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

Syntax

```
► chsecurity ┌ -sslprotocol — security_level ─►
              └ -sshprotocol — security_level ─►
```

Parameters

Remember: These parameters are mutually exclusive. You must specify **-sslprotocol** or **-sshprotocol**, not both.

-sslprotocol security_level

(Required) Specifies the numeric value for the SSL security level setting, which can take any value from 1 to 4. A setting of 3 is the default value.

Use these **sslprotocol** security level settings.

- 1 Disallows SSL 3.0.
- 2 Allows TLS 1.2 only.
- 3 Additionally disallows TLS 1.2 cipher suites that are not exclusive to 1.2.
- 4 Additionally disallows RSA key exchange ciphers.

-sshprotocol security_level

(Required) Specifies the numeric value for the SSH security level setting, which can take a value of 1 or 2. A setting of 1 is the default value.

Use these **sshprotocol** security level settings.

- 1 Allows the following key exchange methods:
 - curve25519-sha256
 - curve25519-sha256@libssh.org
 - ecdh-sha2-nistp256
 - ecdh-sha2-nistp384
 - ecdh-sha2-nistp521
 - diffie-hellman-group-exchange-sha256
 - diffie-hellman-group16-sha512
 - diffie-hellman-group18-sha512
 - diffie-hellman-group14-sha256
 - diffie-hellman-group14-sha1
 - diffie-hellman-group1-sha1
 - diffie-hellman-group-exchange-sha1
- 2 Allows the following key exchange methods:
 - curve25519-sha256
 - curve25519-sha256@libssh.org
 - ecdh-sha2-nistp256
 - ecdh-sha2-nistp384

- ecdh-sha2-nistp521
- diffie-hellman-group-exchange-sha256
- diffie-hellman-group16-sha512
- diffie-hellman-group18-sha512
- diffie-hellman-group14-sha256
- diffie-hellman-group14-sha1

Description

This command changes the SSL, SSH, or TLS security settings on a system.

Important: If you use SSL or TLS, changing the security might disrupt these services.

Use this procedure if disruption occurs.

1. Wait 5 minutes and try again. (Wait for any services to restart.)
2. Confirm that the SSL or TLS implementation is up-to-date and supports the specified level of security.
3. If necessary, revert to an earlier version of SSL or TLS security.

An invocation example

```
chsecurity -sslprotocol 4
```

The resulting output

```
Changing the SSL security level could disable the GUI connection on old web browsers,
and changing the SSH security level may logout existing SSH sessions. Are you sure you wish to
continue? (y/yes to confirm)
```

An invocation example

```
chsecurity -sshprotocol 2
```

The resulting output

```
Changing the SSL security level could disable the GUI connection on old web browsers,
and changing the SSH security level may logout existing SSH sessions. Are you sure you wish to
continue? (y/yes to confirm)
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

[chnodebootdrive](#)

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

[chnodehw \(SVC\) / chnodecanisterhw \(Storwize family products\)](#)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

[chquorum](#)

Use the **chquorum** command to change the quorum association.

[chsite](#)

Use the **chsite** command to change the site name.

[chsra](#)

Use the **chsra** command to configure support assistance.

[chsystem](#)

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

[chsystemcert](#)

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

[chsystemip](#)

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

[chsystemethernet](#)

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

[chthrottle](#)

Use the **chthrottle** command to change attributes associated with a specified throttle object.

[cleardumps](#)

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

swapnode

chsite

Syntax

Parameters

-name *new_site_name*

(Required) Specifies the new name for the site.

site_id* / *existing_site_name

(Required) Specifies the existing site ID or site name that is being changed.

Description

This command changes the site name.

Remember: This command is only applicable when a system is configured as a stretched system or a HyperSwap system (by using the **chsystem -topology** command).

In a stretched configuration these applications are spread across two or more geographic locations or sites:

- Nodes
- Storage
- Host servers
- Infrastructure

An invocation example

```
chsite -name Quorum 3
```

The resulting output:

```
No feedback
```

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmporttip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

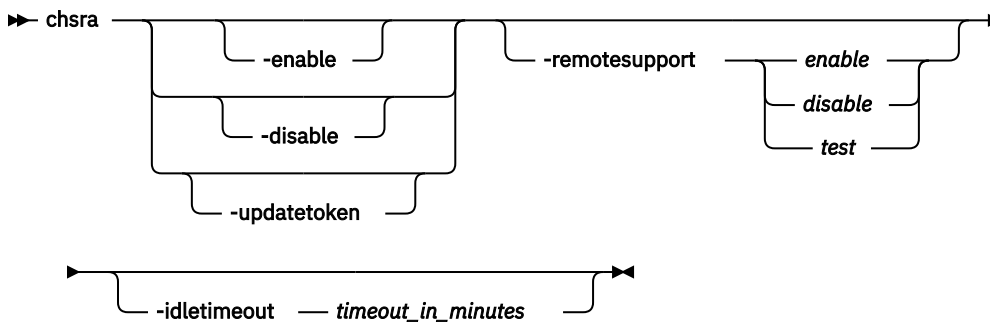

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

chusra

Use the **chusra** command to configure support assistance.

Syntax

Parameters

-enable

(Optional) Creates remote access accounts and enables local support assistance.

-disable

(Optional) Deletes all remote access accounts and disables local and remote support assistance.

-updatetoken

(Optional) Updates the shared security token that is used for support assistance.

-remotesupport *enable / disable / test*

(Optional) Configures remote support assistance directly over the internet or by a configured proxy server. The values are:

- enable
- disable
- test

No default value exists.

-idletimeout *timeout_in_minutes*

(Optional) Enables remote support for a limited amount of time (specified in minutes). The value must be a positive number (integer) denoting how many minutes remote support assistance is idle (and timed out). This parameter does not time out when a support session is in progress on any of your system nodes. It is renewed as many times as needed and only times out after all active sessions are terminated.

Remember: If the idle timeout expires on all participating nodes in a system, remote system support is disabled. If remote system support is disabled, remote system support is not automatically started on events that include:

- When new nodes join the system.
- T3 recovery procedures.
- Node warm or cold starts.

If you specify **-idletimeout**, you must also specify **-remotesupport**.

Description

This command configures local or remote support assistance.

Note: Turn on both local and remote support assistance to more efficiently resolve any problems that are encountered.

Remote support assistance is available either directly over the internet or by using a proxy server. Remote system support is routed by using the proxy server if any proxy servers are configured. You must do the following to turn on remote support assistance:

1. Configure service IP addresses on all nodes.
2. Configure call home on the system.
3. Configure local support assistance on your system, which creates support and sets up authentication. For storage systems that have direct access to the internet, the firewall must allow outbound connections to Internet Protocol (IP) addresses 129.33.206.139 and 204.146.30.139 on port 22. If you must use a proxy server, configure it by using the **mksystemsupportcenter** command.

An invocation example for creating support assistance accounts and enabling local support assistance

```
chsra -enable
```

The detailed resulting output:

```
No feedback
```

An invocation example for deleting support user accounts and disabling local support assistance

```
chsra -disable
```

The detailed resulting output:

```
No feedback
```

An invocation example for updating the shared token that is used for challenge response authentication

```
chsra -updatetoken
```

The detailed resulting output:

```
No feedback
```

An invocation example for enabling remote support assistance

```
chsra -remotesupport enable
```

The detailed resulting output:

```
No feedback
```

An invocation example for enabling remote support assistance for 30 minutes

```
chsra -remotesupport enable -idletimeout 30
```

The detailed resulting output:

```
No feedback
```

An invocation example to test remote support assistance (which is not enabled after test completion)

```
chsra -remotesupport test
```

The detailed resulting output:

```
No feedback
```

Related reference

[addnode](#) (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

Syntax

Parameters

-name *system_name*

(Optional) Specifies a new name for the system.

Important: The Internet Small Computer System Interface (iSCSI) Qualified Name (IQN) for each node is generated by using the system and node names. If you are using the iSCSI protocol, changing either name also changes the IQN of all of the nodes in the system and might require reconfiguration of all iSCSI-attached hosts.

-rcbuffersize *new_size_in_MB*

(Optional) Specifies the amount of memory, in megabytes (MB), to use on each node for Metro Mirror and Global Mirror communications, from 48 to 512 MB. The default is 48 MB.

Important: Adjust this setting only when directed by your support team.

All nodes in the system must be online and have a minimum of 8 gigabytes (GB) - or 8192 megabytes (MB) - of memory to change this setting.

Remember:

- Before changing this setting you must stop all partnerships with this system.
- This parameter operates on the local system only and changing it is disruptive to mirroring operations.

-alias *id_alias*

(Optional) Specifies an alternative name that does not change the basic ID for the system, but does influence the VDisk_UID of newly created volumes. Existing VDisk_UIDs are not changed.

-invemailinterval *interval*

(Optional) Specifies the interval at which inventory emails are sent to the designated email recipients. The interval range is 0 to 15. The interval is measured in days. Setting the value to 0 turns off the inventory email notification function.

-gmlinktolerance *link_tolerance*

(Optional) Specifies the length of time, in seconds, for which an inadequate intersystem link is tolerated for a Global Mirror operation. The parameter accepts values from 20 to 86400 seconds in steps of 10 seconds. The default is 300 seconds. You can disable the link tolerance by entering a value of 0 for this parameter.

-gmmaxhostdelay *max_host_delay*

(Optional) Specifies the maximum time delay, in milliseconds, at which the Global Mirror link tolerance timer starts counting down. This threshold value determines the additional impact that Global Mirror operations can add to the response times of the Global Mirror source volumes. You can use this parameter to increase the threshold from the default value of 5 milliseconds.

-icatip *icat_console_ip_address*

(Optional) Specifies the system's new IPv4 address that is used by the system. The format of this IP address must be a dotted decimal notation with the port; for example, 255.255.255.255:8080. If you specify this parameter, it overwrites any existing -icatip_6 address.

-icatip_6 *icat_console_ipv6_address*

(Optional) Specifies the system's new IPv6 address. If you specify this parameter, it overwrites any existing -icatip address. The format of the IPv6 address must be:

- Eight colon-separated groups of four hexadecimal digits; for example:

```
[1234:1234:abcd:0123:0000:0000:7689:6576]:23
```

- Eight colon-separated groups of hexadecimal digits with leading zeros omitted; for example:

```
[1234:1234:abcd:123:0:0:7689:6576]:23
```

- Suppression of one or more consecutive all 0 groups; for example:

```
[1234:1234:abcd:123::7689:6576]:23
```

-ntpip ipv4_ntp_ip_address

(Optional) Specifies the IPv4 address for the Network Time Protocol (NTP) server. Configuring an NTP server address causes the system to use that NTP server as its time source. Specify the **-ntpip** parameter with a zero address to use another time source:

```
chsystem -ntpip 0.0.0.0
```

-ntpip_6 ipv6_ntp_ip_address

Note: Before you specify **-ntpip_6**, an IPv6 prefix and gateway must be set for the system.

(Optional) Specifies the IPv6 address for the NTP server. Configuring an NTP server address causes the system to immediately start using that NTP server as its time source. To choose another time source, specify the **-ntpip_6** parameter with a zero address, as follows:

```
chsystem -ntpip_6 0::0
```

-isnsip sns_server_address

(Optional) Specifies the IPv4 address for the iSCSI storage name service (SNS). Specify the **-isnsip** parameter with a zero address to select another IPv4 iSCSI SNS server:

```
chsystem -isnsip 0.0.0.0
```

-isnsip_6 ipv6_sns_server_address

(Optional) Specifies the IPv6 address for the iSCSI SNS. Specify the **-isnsip_6** parameter with a zero address to select another configured IPv6 iSCSI SNS server:

```
chsystem -isnsip_6 0::0
```

-relationshipbandwidthlimit bandwidth_in_mBps

(Optional) Specifies the new background copy bandwidth in megabytes per second (MBps), from 1 to 1000. The default is 25 MBps.

This parameter operates system-wide and defines the maximum background copy bandwidth that any relationship can adopt. The existing background copy bandwidth settings that are defined on a partnership continue to operate, with the lower of the partnership and volume rates attempted.

Note: Do not set this value higher than the default without establishing that the higher bandwidth can be sustained.

-infocenterurl url

Specifies the preferred online documentation URL to override the one used by the GUI. Because this information is interpreted by the Internet browser, the specified information might contain a hostname or an IP address.

Remember: View the currently configured URL in the GUI preferences window. This window can also help reset this value to the default setting.

-iscsiauthmethod none | chap -chapsecret chap_secret

(Optional) Sets the authentication method for the iSCSI communications of the system:

- chap indicates Internet Small Computer System Interface (iSCSI) authentication is turned on.

Remember: This turns on iSCSI partnership authentication when a Challenge Handshake Authentication Protocol (CHAP) secret key is set for the system.

- none indicates that iSCSI partnership authentication is turned off.

-rcauthmethod none | chap -chapsecret chap_secret

(Optional) Turns authentication on or off for remote copy partnership requests that are native IP partnerships. Remote copy includes Metro Mirror, Global Mirror, and HyperSwap. Additionally:

- chap indicates that remote copy authentication is turned on.

Remember: This action turns on authentication of remote copy partnership requests when a Challenge Handshake Authentication Protocol (CHAP) secret key is set for the system.

-vdiskprotectiontime *value_in_minutes*

(Optional) Sets volume protection time (in minutes). The range is 15 - 1440.

-vdiskprotectionenabled *yes / no*

(Optional) Enables or disables volume protection. The values are yes and no.

-odx *on / off*

(Optional) Enables or disables offloaded data transfers (ODX). The values are on and off.

-easytieracceleration *on / off*

(Optional) Enables Easy Tier and pool balancing acceleration. The values are on and off.

-maxreplicationdelay *value_in_seconds*

(Optional) Sets a maximum replication delay in seconds. The value must be a number from 0 to 360.

-partnershipexclusionthreshold *value_in_seconds*

(Optional) Sets the timeout for an I/O operation (in seconds) for remote systems. The value must be a number from 30 to 315 (default).

-ibmcustomer *customer_id*

(Optional) Specifies the customer number assigned when a software license that is automatically added to the entitlement database. The value must be a number that contains 7 - 10 digits (or blank).

-ibmcomponent *component_id*

(Optional) Specifies the component ID used for entitlement and call home system. The value is blank or SANVCNSW1.

-ibmcountry *country_id*

(Optional) Specifies the country ID used for entitlement and call home system. The value is blank or a 3-digit number.

-enhancedcallhome *on / off*

(Optional) Specifies that the call home function is to send enhanced reports to the support center. Valid values are yes or no.

The enhanced reports include operational and event-related data and specific configuration information that is included in the inventory report. This function alerts the support center about hardware failures and potentially serious configuration or environmental issues. The support center can use the configuration information to automatically generate best practices or recommendations that are based on your actual configuration.

-censorcallhome *on / off*

(Optional) Specifies that sensitive data is deleted from the enhanced call home data. The values are yes or no.

-hostunmap *on / off*

(Optional) Specifies whether the administrator wants the volumes to advertise support for unmap to hosts. The values are on or off (default).

-backendunmap *on / off*

(Optional) Specifies whether the administrator wants to enable SCSI Unmap support for backend storage. Enabling this parameter allows the system to issue SCSI Unmap or Write Same commands to compatible backend storage controllers and drives to reclaim capacity when capacity is freed within the system. The values are on (default) or off.

-quorummode *standard / preferred / winner*

(Optional) Specifies the mode that quorum uses for tie-breaking. The valid values are **standard (default)**, **preferred**, or **winner**.

-quorumsite *site_id / site_name*

(Required) Specifies the site ID or name that quorum uses for tie-breaking when **-quorummode** is set to **preferred** or **winner**.

-quorumlease *short / long*

(Optional) Specifies the mode that quorum uses for tie-breaking. The valid values are **short (default)** or **long**.

Description

This command modifies specific features of a system. Multiple features can be changed by issuing a single command.

Using the **-ntpip** or **-ntpip_6** parameter allows the system to use an NTP server as an outside time source. The system adjusts the system clock of the configuration node according to time values from the NTP server. The clocks of the other nodes are updated from the configuration node clock. In the NTP mode, the **setsystemtime** command is disabled.

Note: For IBM Spectrum Virtualize for Public Cloud on Amazon Web Services (AWS), do not manually set the NTP for the system. The system time must be synchronous with the AWS NTP, or some AWS APIs might fail. A default AWS NTP was set during installation.

All command parameters are optional, but you must specify at least one parameter.

Use the **chsystemip** command to modify the system IP address and service IP address.

Remember: Setting a CHAP secret key for the system does not turn on authentication for iSCSI hosts or remote copy partnerships. Remote copy includes Metro Mirror, Global Mirror, and HyperSwap. Turn off authentication by issuing **-iscsiauthmethod** or **-rciauthmethod**.

The topology can be set to HyperSwap only if node sites have been configured. All nodes must have a site defined. If both nodes are defined in an I/O group they must be assigned to the same site (either 1 or 2; 3 cannot be used for nodes). You must have at least one I/O group with both nodes in site 1 and at least one I/O group with both nodes in site 2.

Note: If there are any active relationships defined, the system topology must be HyperSwap.

An invocation example

```
chsystem -ntpip 9.20.165.16
```

The resulting output:

```
No feedback
```

An invocation example to set up an external NTP server

```
chsystem -ntpip 123.234.123.234
```

The resulting output:

```
No feedback
```

An invocation example to change the preferred infocenterurl value

```
chsystem -infocenterurl http://miscserver.company.com/ibm/infocenter
```

The resulting output:

```
No feedback
```

An invocation example to change the local port mask value

To indicate that FC I/O ports with IDs 3 and 4 of an eight port system are capable of local node communication:

```
chsystem -localfcportmask 00001100
```

The resulting output:

```
No feedback
```

An invocation example to change the partner port mask value

To indicate that FC ports with IDs 7 and 8 of an eight port system are capable of remote node communication:

```
chsystem -partnerfcportmask 11000000
```

The resulting output:

```
No feedback
```

An invocation example to change the HTM

```
chsystem -hightempmode on
```

The resulting output:

```
No feedback
```

An invocation example to set the system topology

```
chsystem -topology standard
```

The resulting output:

```
No feedback
```

An invocation example to set authentication for remote copy

```
chsystem -chapsecret ABCB1234 -iscsiauthmethod none -rcauthmethod chap
```

The resulting output:

```
No feedback
```

An invocation example to turn off volume protection

```
chsystem -vdiskprotectionenabled no
```

The resulting output:

```
No feedback
```

An invocation example to turn on volume protection and set the protection time to 60 minutes

```
chsystem -vdiskprotectionenabled yes -vdiskprotectiontime 60
```

The resulting output:

```
No feedback
```

An invocation example to turn on Easy Tier acceleration

```
chsystem -easytieracceleration on
```

The resulting output:

```
No feedback
```

An invocation example to turn on ODX

```
chsystem -odx on
```

The resulting output:

```
No feedback
```

An invocation example to set the maximum replication delay

```
chsystem -maxreplicationdelay 100
```

The resulting output:

```
No feedback
```

An invocation example to set the partnership exclusion threshold

```
chsystem -partnershipexclusionthreshold 120
```

The resulting output:

```
No feedback
```

An invocation example to specify an IBM customer ID, component ID, and country ID

```
chsystem -ibmcustomer 1928374 -ibmcomponent SANVCNSW1 -ibmcountry 001
```

The resulting output:

```
No feedback
```

An invocation example to turn off enhanced call home

```
chsystem -enhancedcallhome off
```

The resulting output:

```
No feedback
```

An invocation example to turn on censor call home

```
chsystem -censorcallhome on
```

The resulting output:

```
No feedback
```

An invocation example to turn on hostunmap and backendunmap

```
chsystem -hostunmap on -backendunmap on
```

The resulting output:

```
No feedback
```

addnode (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

addiscsistorageport

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

cfgportip

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsscsiportauth

Use the **lsscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsscsistorageport

Use the **lsscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsscsistorageportcandidate

Use the **lsscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

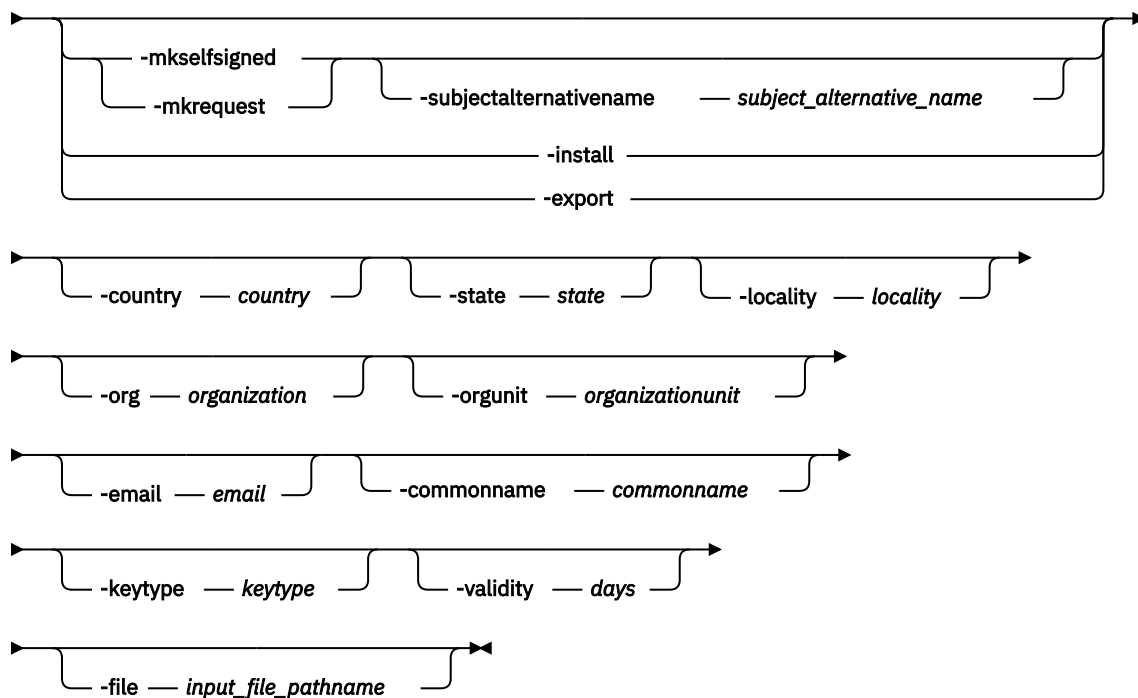

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

Syntax

➤ chsystemcert ➔

Parameters

-mkselfsigned

(Optional) Generates a self-signed SSL certificate. If you do not specify **-mkselfsigned**, you must specify **-mkrequest**, **-export**, or **-install**.

-mkrequest

(Optional) Generates a certificate request. If you do not specify **-mkrequest**, you must specify **-mkselfsigned**, **-export**, or **-install**.

-install

(Optional) Install a certificate. If you do not specify **-install**, you must specify **-mkselfsigned**, **-mkrequest**, or **-export**.

-export

(Optional) Exports the current SSL certificate. The certificate is exported to the `/dumps/certificate.pem` directory on the configuration node. If you do not specify **-export**, you must specify **-mkselfsigned**, **-mkrequest**, or **-install**.

-subjectalternativenamename *subject_alternative_name*

(Optional) If specified, this parameter allows free-form input data for the Subject Alternative Name field of the self-signed certificate and the certificate signing request. The new information is included under Requested Extensions and under the subsection X509v3 Extensions: Subject Alternative Name. You can specify this parameter only with **-mkselfsigned** or **-mkrequest**.

-country *country*

For **-mkselfsigned**, this parameter specifies the 2-digit country code for the self-signed certificate.

For **-mkrequest**, this parameter specifies the 2-digit country code for the certificate request.

-state *state*

For **-mkselfsigned**, this parameter specifies the state information for the self-signed certificate. The value can be an ASCII string from 0 - 128 characters.

For **-mkrequest**, this parameter specifies the state information for the certificate request. The value can be an ASCII string from 0 - 128 characters.

-locality *locality*

For **-mkselfsigned**, this parameter specifies the locality information for the self-signed certificate. The value can be an ASCII string in the range 0 - 128 characters.

For **-mkrequest**, this parameter specifies the locality information for the certificate request. The value can be an ASCII string in the range 0 - 128 characters.

-org *organization*

For **-mkselfsigned**, this parameter specifies the organization information for the SSL certificate. The value can be an ASCII string in the range 0 - 64 characters.

For **-mkrequest**, this parameter specifies the organization information for the SSL certificate. The value can be an ASCII string in the range 0 - 128 characters.

-orgunit *organizationunit*

For **-mkselfsigned**, this parameter specifies the organization unit information for the SSL certificate. The value can be an ASCII string in the range 0 - 64 characters.

For **-mkrequest**, this parameter specifies the organization unit information for the SSL certificate. The value can be an ASCII string in the range 0 - 64 characters.

-email *email*

For **-mkselfsigned**, this parameter specifies the email address that is used in the SSL certificate. The value can be an ASCII string in the range 0 - 64 characters.

For **-mkrequest**, this parameter specifies the email address that is used in the SSL certificate. The value can be an ASCII string in the range 0 - 64 characters.

-commonname *commonname*

For **-mkselfsigned**, this parameter specifies the common name for the SSL certificate. The value can be an ASCII string of 0 - 64 characters.

For **-mkrequest**, this parameter specifies the common name for the SSL certificate. The value can be an ASCII string of 0 - 64 characters.

-validity *days*

Specifies the number of days (1-9000) that the self-signed certificate is valid.

-keytype *keytype*

Specifies the SSL certificate key type.

- `rsa2048`

- ecdsa384
- ecdsa521

-file

Specifies the absolute path name of the certificate to install.

-force

Specifies that the certificate request can be deleted.

Description

Use this command to manage the SSL certificate that is installed on a system. You can also do the following items.

- Generate a new self-signed SSL certificate.
 - Create a certificate request to be copied from the system and signed by a certificate authority (CA).
- Note:** The signed certificate that is returned by the CA can be installed.
- Export the current SSL certificate (for example to allow the certificate to be imported into a key server).

Important: You must specify one of the following parameters:

- **-mkselfsigned**
- **-mkrequest**
- **-install**
- **-export**

An invocation example to create a self-signed certificate

```
chsystemcert -mkselfsigned
```

The detailed resulting output

```
No feedback
```

An invocation example to create a self-signed certificate with a common name

```
chsystemcert -mkselfsigned -commonname weiland.snpp.com
```

The detailed resulting output

```
No feedback
```

An invocation example to create a self-signed certificate with a key type and a 1-year validity period

```
chsystemcert -mkselfsigned -keytype ecdsa521 -validity 365
```

The detailed resulting output

```
No feedback
```

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode** / **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

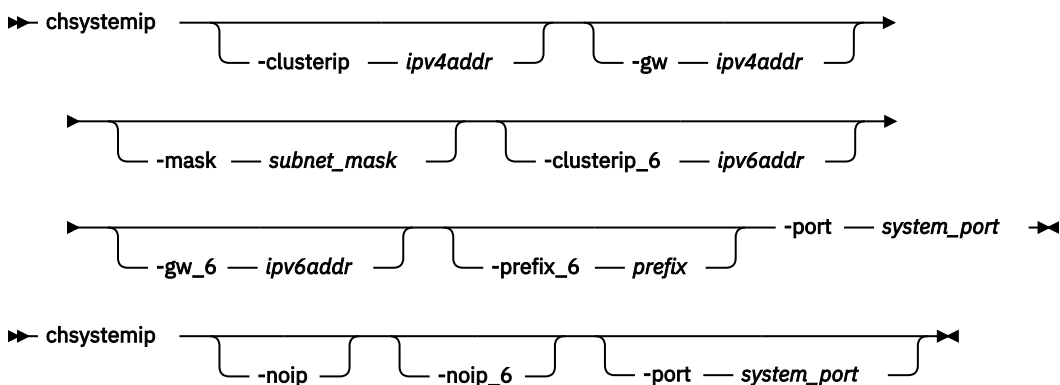

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

Syntax

Parameters

-clusterip *ipv4addr*

(Optional) Changes the IPv4 system IP address. When you specify a new IP address for a system, the existing communication with the system is broken.

Important: The **-clusterip** parameter cannot be used if there are any active IPv4 partnerships with the system.

-gw *ipv4addr*

(Optional) Changes the IPv4 default gateway IP address of the system.

-mask *subnet_mask*

(Optional) Changes the IPv4 subnet mask of the system.

-noip

(Optional) Unconfigures the IPv4 stack on the specified port, or both ports if none is specified.

Note: This parameter does not affect node service address configurations.

-clusterip_6 *ipv6addr*

(Optional) Sets the IPv6 system address for the port.

Important: The **-clusterip_6** parameter cannot be used if there are any active IPv6 partnerships with the system.

-gw_6 *ipv6addr*

(Optional) Sets the IPv6 default gateway address for the port.

-prefix_6 *prefix*

(Optional) Sets the IPv6 prefix.

-noip_6

(Optional) Unconfigures the IPv6 stack on the specified port, or both ports if none is specified.

Note: This parameter does not affect node service address configurations.

-port *system_port*

(Required) Specifies which port (1 or 2) to apply changes to. This parameter is required unless the **noip** or **noip_6** parameter is used.

Description

This command modifies IP configuration parameters for the system. The first time you configure a second port, all IP information is required. Port 1 on the system must always have one stack fully configured.

There are two active system ports on the configuration node. There are also two active service ports on any node in which you are performing a service action.

If the system IP address is changed, the open command-line shell closes during the processing of the command. You must reconnect to the new IP address if connected through that port.

If there is no port 2 available on any of the system nodes, the **chssystemip** command fails.

The **noip** and **noip_6** parameters can be specified together only if the **port** is also specified. The **noip** and **noip_6** parameters cannot be specified with any parameters other than **port**.

Note: The **noip** and **noip_6** parameters do not affect node service address configurations.

Port 1 must have an IPv4 or IPv6 system address. The configuration of port 2 is optional.

Service IP addresses for all ports and stacks are initialized to Dynamic Host Configuration Protocol (DHCP). A service IP address is always configured.

Note: If the `console_ip` is the same as IP address system port 1, Internet Protocol Version 4 (IPv4) followed by IPv6, change the `console_ip` when the system IP is changed. If the `console_ip` differs from the system port 1 IP address, do not change the `console_ip` when the system IP is changed.

To modify an IP address, list the IP address of the system by issuing the **lssystem** command. Modify the IP address by issuing the **chsystemip** command. You can either specify a static IP address or have the system assign a dynamic IP address.

This table provides IP address formats that are supported.

Table 33. IP address list formats	
IP type	IP address list format
IPv4	1.2.3.4
Full IPv6	1234:1234:abcd:0123:0000:0000:7689:6576
Full IPv6, leading zeros suppressed	1234:1234:abcd:123:0:0:7689:6576
IPv6 with zero compression	1234:1234:abcd:123::7689:6576

An invocation example

```
chsystemip -clusterip 9.20.136.5 -gw 9.20.136.1 -mask 255.255.255.0 -port 1
```

The resulting output:

```
No feedback
```

An invocation example

```
chsystemip -clusterip_6 2001:0db8:85a3:0000:0000:8a2e:0370:7334 -gw_6  
2001:0db8:85a3:0000:0000:8a2e:0370:7334 -prefix_6 64 -port 2
```

The resulting output:

```
No feedback
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

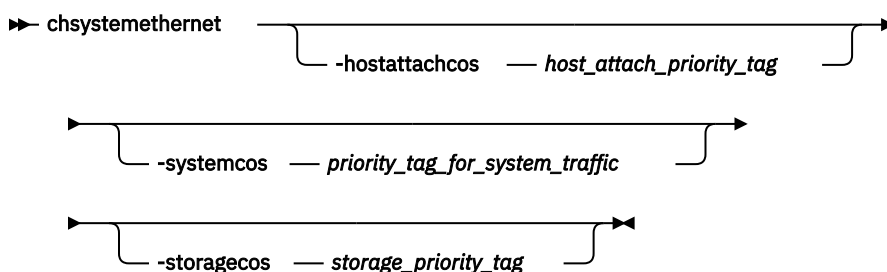

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

Syntax

Parameters

-hostattachcos *host_attach_priority_tag*

(Optional) Specify the system-wide host attach priority tag that you want to be used by all host attach traffic over iSCSI, iSER, or NVMeF. The value must be in the range 0 (default) - 7.

-systemcos *priority_tag_for_system_traffic*

(Optional) Specify the system-wide clustering priority tag that you want to be used by system traffic. The value must be in the range 0 (default) - 7.

-storagecos *storage_priority_tag*

(Optional) Specify the system-wide storage priority tag that you want to be used by storage traffic. The value must be in the range 0 (default) - 7.

Description

Use the **chsystemethernet** command to set system-wide Ethernet related properties. This command affects all existing and new iSCSI sessions. The priority of iSCSI packets changes immediately after the priority tag is changed by using the **chsystemethernet** command. Existing iSER sessions continue to use the old priority tag values. To change the priority tag value for an iSER session, the command must be used before any connections are established or you must close and reestablish all the connections after you run the command so the priority tag values take effect.

Note: PFC is supported on Lancer and Chelsio. PFC is not supported on Mellanox and Intel.

An invocation example to set the host attach priority tag (class of service) to 4, system priority tag to 5, and storage priority tag to 6.

```
chsystemethernet -hostattachcos 4 -systemcos 5 -storagecos 6
```

The resulting output:

```
No feedback
```

An invocation example to set the host attach priority tag (class of service) to 4.

The existing system priority and storage priority values remain unchanged.

```
chsystemethernet -hostattachcos 4
```

The resulting output:

```
No feedback
```

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/ **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

Syntax

Parameters

-bandwidth *bandwidth_limit_in_mb*

(Optional) Specifies the bandwidth in MBps. This must be a numeric value 0 - 268435456.

Note: No bandwidth limit is set unless you specify this keyword.

-iops *iops_limit*

(Optional) Specifies the I/O operations limit. This must be a numeric value 0 - 33554432.

Note: No I/O operations limit is set unless you specify this keyword.

-name *throttle_name*

(Optional) Specifies the throttling object's name. This value must be an alphanumeric string up to 63 characters long.

throttle_id* / *throttle_name

(Required) Specifies the volume ID or name of the volume to throttle. The value must be a numeric or alphanumeric string up to 15 characters long.

Description

This command changes attributes associated with a specified throttle object.

Note: The throttle limits are per node.

An invocation example for changing the bandwidth limit to 100 for an offloaded throttle

```
chthrottle -bandwidth 100 offloadThrottle
```

The detailed resulting output:

```
No feedback
```

An invocation example with no throttling bandwidth limit specified for ID 0

```
chthrottle -bandwidth 100 0
```

The detailed resulting output:

```
No feedback
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

addiscsistorageport

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

cfgportip

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional.

However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrpghost

Use the **lsiogrpghost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsisstorageport

Use the **rmiscsisstorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopssystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

[swapnode](#)

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

Syntax

➤ **cleardumps** — **-prefix** — *directory_or_file_filter* 

Parameters

-prefix directory_or_file_filter

(Required) Specifies the directory, files, or both to be cleared. If a directory is specified, with no file filter, all relevant dump or log files in that directory are cleared. You can use the following directory arguments (filters):

- /dumps (clears all files in all subdirectories)
- /dumps/cimom
- /dumps/cloud
- /dumps/configs
- /dumps/easytier
- /dumps/elogs
- /dumps/feature
- /dumps/iostats
- /dumps/iotrace
- /dumps/mdisk
- /home/admin/upgrade

In addition to the directory, you can specify a filter file. For example, if you specify /dumps/elogs/
*.txt, all files in the /dumps/elogs directory that end in .txt are cleared.

Note: The following rules apply to the use of wildcards when using the CLI:

- The wildcard character is an asterisk (*).
- The command can contain a maximum of one wildcard.
- With a wildcard, you must use double quotation marks (" ") around the filter entry, such as in the following entry:

```
>cleardumps -prefix "/dumps/elogs/*.txt"
```

node_id / node_name

(Optional) Specifies the node to be cleared. The variable that follows the parameter is either:

- The node name, that is, the label that you assigned when you added the node to the system.
- The node ID that is assigned to the node (not the worldwide node name).

Description

This command deletes all the files that match the `directory/file_filter` argument on the specified node or node canister. If no node is specified, the configuration node is cleared.

You can clear all the dumps directories by specifying `/dumps` as the directory variable.

You can clear all the files in a single directory by specifying one of the directory variables.

You can list the contents of these directories on the given node or node canister by using the **lsxxxxdumps** commands.

You can use this command to clear specific files in a given directory by specifying a directory or file name. You can use the wildcard character as part of the file name.

Note: To preserve the configuration and trace files, any files that match the following wildcard patterns are not cleared:

- `*svc.config*`
- `*.trc`
- `*.trc.old`

An invocation example

```
cleardumps -prefix /dumps/configs
```

The resulting output:

```
No feedback
```

An invocation example

```
cleardumps -prefix /dumps/easytier node_2
```

The resulting output:

```
No feedback
```

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode** / **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

Note: In the rare event that the /dumps directory on the configuration node is full, the copy action ends when the directory is full and provides no indicator of a failure. Therefore, clear the /dumps directory after migrating data from the configuration node.

Syntax

```
➤ cpdumps — -prefix — directory — node_name —
                  |         |         |
                  |         |         |
                  file_filter node_id
```

Parameters

-prefix directory | file_filter

(Required) Specifies the directory, or files, or both to be retrieved. If a directory is specified with no file filter, all relevant memory dump or log files in that directory are retrieved. You can use the following directory arguments (filters):

- /dumps (retrieves all files in all subdirectories).
- /dumps/audit
- /dumps/cimom
- /dumps/cloud
- /dumps/configs
- /dumps/elogs
- /dumps/easytier
- (Storwize V7000)/dumps/enclosure
- /dumps/feature
- /dumps/iostats
- /dumps/iotrace
- /dumps/mdisk
- /home/admin/update

In addition to the directory, you can specify a file filter. For example, if you specified /dumps/elogs/*.txt, all files in the /dumps/elogs directory that end in .txt are copied.

Note: The following rules apply to the use of wildcards with the CLI:

- The wildcard character is an asterisk (*).
- The command can contain a maximum of one wildcard.
- When you use a wildcard, you must surround the filter entry with double quotation marks (""), as follows:

```
>cleardumps -prefix "/dumps/elogs/*.txt"
```

node_id / node_name

(Required) Specifies the node from which to retrieve the memory dumps. The variable that follows the parameter can be one of the following:

- The node name, or label that you assigned when you added the node to the system.
- The node ID that is assigned to the node (not the worldwide node name).

If the node specified is the current configuration node, no file is copied.

Description

This command copies any memory dumps that match the directory or file criteria from the given node to the current configuration node.

You can retrieve memory dumps that were saved to an old configuration node. During failover processing from the old configuration node to another node, the memory dumps that were on the old configuration node are not automatically copied. Because access from the CLI is only provided to the configuration node, system files can only be copied from the configuration node. This command enables you to retrieve files and place them on the configuration node so that you can then copy them.

You can view the contents of the directories by using the **lsdumps** command. You can track the status of a copy using the **lscopystatus** command.

An invocation example

```
cpdumps -prefix /dumps/configs nodeone
```

The resulting output:

```
No feedback
```

An invocation example

```
cpdumps -prefix /dumps/easytier node_2
```

The resulting output:

```
No feedback
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

[chnodebootdrive](#)

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

[chnodehw \(SVC\) / chnodecanisterhw \(Storwize family products\)](#)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

ls_timezone

Use the **ls_timezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **set_timezone** command to set the time zone.

ls_sasportcandidate

Use the **ls_sasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

ls_security

Use the **ls_security** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

ls_site

Use the **ls_site** command to report the names of the sites.

ls_sra

Use the **ls_sra** command to check both secure remote assistance status and the time of the last login.

ls_throttle

Use the **ls_throttle** command to list throttle objects that are configured in the clustered system.

ls_system

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

-targetip *ipv4_addr*

(Required if you do not specify **-targetip6**) Specifies the target iSCSI controller IPv4 address being detected that receives target discovery requests by using the *source_port_id* for all nodes in the specified I/O group.

-targetip6 *ipv6_addr*

(Required if you do not specify **-targetip**) Specifies the target iSCSI controller IPv6 address being detected that receives target discovery requests by using the *source_port_id* for all nodes in the specified I/O group.

-username *target_user_name*

(Optional) Specifies the target controller user name being detected. The value must be an alphanumeric string up to 256 characters.

If the target controller requires a *target_user_name* and *target_chap* for discovery, use the target user name and Challenge-Handshake Authentication Protocol (CHAP) secret to discover the iSCSI target controller.

Some controllers might require that you use the iSCSI qualified name (IQN) user name for discovery. Each nodes IQN is picked up automatically and used if required.

-chapsecret *target_chap*

(Optional) Specifies the *target_chap* required for discovery of the target iSCSI controller that is being detected. The value must be an alphanumeric string (case-sensitive) up to 79 characters.

-site *site_id* / *site_name*

(Optional) Specifies the site ID or site name of the target iSCSI controller that is being detected or discovered. If no I/O group is specified, discovery is done from all nodes present in the specified site and if an I/O group is specified discovery is done only from a node that is part of the specified site and I/O group. The site ID must be 1 (the default) or 2. The site name must be an alphanumeric value.

Important: This parameter must be specified for a HyperSwap or stretched system.

The stretched system topology distributes the I/O group information into each site. Each node in the I/O group is associated with a different site. The back end storage controller of one site is visible only to nodes within that same site. As a result, you attempt storage controller discovery only from nodes that are in the same site.

Description

This command detects iSCSI backend storage controllers for migration and virtualization. This command helps with target iSCSI controller discovery. Use the **lsiscsistorageportcandidate** command to list information about the discovered candidate iSCSI target controller(s).

The target data is available until either another discovery is completed or the system undergoes a recovery procedure, which clears the previous discovery data. The command completes when either discovery from all source nodes completes or the command fails.

Use the **addiscsistorageport** command to establish sessions from any nodes in a specified I/O group to a discovered backend iSCSI controller. Use the **lsiscsistorageportcandidate** command to list information about the candidate iSCSI target controller.

A target discovery invocation example with IP address

This example shows target discovery using an IPv4 IP address with a target iSCSI controller and source port ID 1.

```
detectiscsistorageportcandidate -srcportid 1 -targetip IP1
```

The detailed resulting output:

```
No feedback
```

A target discovery invocation example with source port ID and I/O group

This example shows target discovery from I/O group 3 using an IPv4 address with a target iSCSI controller and source port ID 3.

```
detectiscsistorageportcandidate -srcportid 3 -targetip IP3 -iogrp 3 -username delluser -  
chapsecret password1
```

The detailed resulting output:

```
No feedback
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

[chnodebootdrive](#)

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lscsiportauth

Use the **lscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lscsisstorageport

Use the **lscsisstorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lscsisstorageportcandidate

Use the **lscsisstorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

ls_timezone

Use the **ls_timezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **set_timezone** command to set the time zone.

ls_sasportcandidate

Use the **ls_sasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

ls_security

Use the **ls_security** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

ls_site

Use the **ls_site** command to report the names of the sites.

ls_sra

Use the **ls_sra** command to check both secure remote assistance status and the time of the last login.

ls_throttle

Use the **ls_throttle** command to list throttle objects that are configured in the clustered system.

ls_system

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

Related reference

addnode (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

addiscsistorageport

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

cfgportip

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands.

All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setssystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

help

Use the **help** (or **man**) command to display help information for system commands.

Syntax

Parameters

command_name

(Optional) Indicates the command name.

Description

Use this command to display help information for system commands. If you specify a command name using *command_name*, the complete help file text for the command is displayed. If you do not specify a command name, a comprehensive list of all commands is displayed (with one brief descriptive line). This list includes these commands:

- satask
- sainfo
- svcconfig
- svc_snap
- svc_livedump

Remember: The **help** command alias is **man**.

An invocation example

```
help
```

The resulting output:

```
addhostiogr - Maps I/O groups to a host object.  
addhostport - Adds worldwide port names (WWPNs) or iSCSI names to a host object.  
addmdisk - Adds managed disks to a storage pool.  
addnode - Adds a new (candidate) node canister to an existing system.  
...
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogr](#)

Use the **chiogr** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

[chnodebootdrive](#)

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/ **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

ls_timezone

Use the **ls_timezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **set_timezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

Related reference

addnode (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

addiscsistorageport

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

cfgportip

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands.

All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

Related reference

addnode (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

addiscsistorageport

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

cfgportip

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrpghost

Use the **lsiogrpghost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

[rmthrottle](#)

Use the **rmthrottle** command to remove the throttle object associated with any volume.

[setclustertime](#) (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

[setsystemtime](#)

Use the **setsystemtime** command to set the time for the system.

[setpwdreset](#)

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

[settimezone](#)

Use the **settimezone** command to set the time zone for the system.

[showtimezone](#)

Use the **showtimezone** command to display the current time zone settings for the cluster.

[startstats](#)

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

[stopstats](#) (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

[stopcluster](#) (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

[stopsystem](#)

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

[swapnode](#)

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

Related reference

[addnode](#) (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode** / **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

Related reference

addnode (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of

the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

addiscsistorageport

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

cfgportip

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lszones

Use the **lszones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

Syntax

Parameters

-filtervalue attribute=value

(Optional) Specifies a list of one or more filters. Only objects with a value that matches the filter attribute value are displayed.

Note: Some filters allow the use of a wildcard when you enter the command. The following rules apply to the use of wildcards:

- The wildcard character is the asterisk (*).
- The command can contain a maximum of one wildcard.
- When you use a wildcard, enclose the filter entry within double quotation marks (""):
`lsdiscoverystatus -filtervalue "IO_group_name=io*"`

-filtervalue?

(Optional) Displays the valid filter attributes for the **-filtervalue** parameter:

- IO_group_id
- IO_group_name
- scope
- status

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

Description

This command displays the state of all discoveries in the cluster. During discovery, the system updates the drive and MDisk records. You must wait until the discovery finishes and is inactive before you attempt to use the system. This command displays one of the following results:

active

There is a discovery operation in progress at the time that the command is issued.

inactive

There are no discovery operations in progress at the time that the command is issued.

If the Fibre Channel functions are used only to enable the nodes to cluster, then the Fibre Channel line are not displayed in the **lsdiscoverystatus** command. The *fc_fabric* line appears if there is at least one Fibre Channel controller.

An invocation example

```
lsdiscoverystatus -delim :
```

The resulting output:

```
id:scope:IO_group_id:IO_group_name:status
0:fc_fabric:::active
1:sas_iogrp:0:io_grp0:inactive
3:sas_iogrp:2:io_grp2:active

6:iscsi:::inactive
```

Related reference

[addnode](#) (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster](#) (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/ **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setssystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

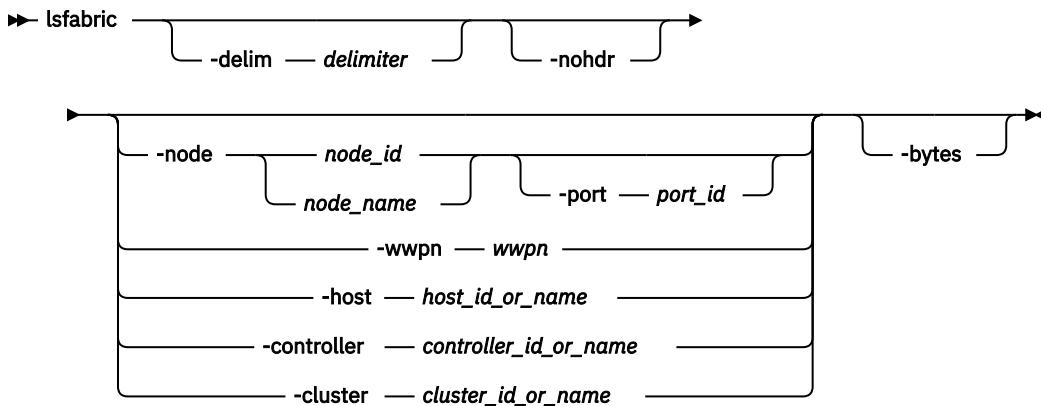

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its

own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

-node *node_name* / *node_id*

(Optional) Displays the output for all ports for the specified node. The only parameter that you can specify with the **-node** parameter is the **-port** parameter.

-port *port_id*

(Optional) Displays a concise view of all worldwide port names (WWPNs) that are logged into the specified port ID and node. The **-port** parameter must be specified with only the **-node** parameter. A valid *port_id* value is from a minimum of one through a maximum equal to the number of node Fibre Channel (FC) I/O ports. It specifies the port number in the vital product data (VPD) or the hexadecimal WWPN of the local port.

-wwpn *wwpn*

(Optional) Displays a list of all ports that have a login to the specified WWPN. You cannot use the **-wwpn** parameter with any other parameter.

-host *host_id_or_name*

(Optional) Specifies a host name or ID. Issuing the **lsfabric** command with the **-host** parameter is equivalent to issuing the **lsfabric wwpn wwpn** command for every configured WWPN of the specified host. For example, a host with two ports that are zoned to one port of every node in an eight-node system produces 16 lines of output. You cannot use the **-host** parameter with any other parameter.

-controller *controller_id_or_name*

(Optional) Specifies a controller ID or name. You cannot use the **-controller** parameter with any other parameter in this command. Issuing the **lsfabric** command with the **-controller** parameter is equivalent to issuing the **lsfabric wwpn wwpn** command for every configured WWPN of the specified controller. For example, a controller with four ports that are connected to an eight node system with two counterpart SANs produces 64 lines of output.

-cluster *cluster_id_or_name*

(Optional) Specifies a system ID or name. You cannot use the **-cluster** parameter with any other parameter. Issuing the **lsfabric** command with the **-cluster** parameter is equivalent to issuing the **lsfabric wwpn wwpn** command for every known WWPN in the specified system. Output is sorted by remote WWPNs and then system WWPNs. This parameter can be used to check the state of connections within the local system or between the local and remote system. When the local system ID or name is specified, each node-to-node connection is listed twice: once from each end. For example, an eight-node system with two counterpart SANs produces eight nodes, which are multiplied by seven other nodes, which are multiplied by two SANs, multiplied by four point-to-point logins, equals 448 lines of output.

Note: The system must be configured in a remote copy partnership with the local system. Remote copy includes Metro Mirror, Global Mirror, and HyperSwap. It must appear in the **lssystem** view.

-bytes

(Optional) Displays all capacities as bytes.

Description

The **lsfabric** command can be issued with any of the parameters to display a limited subset of information. If the command is issued without any parameters, it provides output for every node.

Remember: The value of the `local_port` field is the number of the node's Fibre Channel (FC) port.

Values for the Type and State columns are:

state active

The meaning of this value depends on the object that it applies to, as follows:

host or controller

Small Computer System Interface (SCSI) commands were issued within the last 5 minutes.

node

Node ports can see other ports.

state inactive

No transactions completed within the last 5 minutes.

Note: It can take up to 10 seconds after a command for a controller port to change from inactive to active. It can take up to 5 minutes after a command for a host port to change from inactive to active.

state blocked

The meaning of this value depends on the object that it applies to, as follows: host - Host ports that are blocked due to the host's port mask settings or the current N_Port ID Virtualization (NPIV) status in the I/O group. node - Node ports that are blocked due to the system's port mask settings.

type

One of the following values is displayed:

- host
- node
- controller
- unknown
- nas

You can issue this command to view all the information about the connections that are available to your system.

Remember: The **lsfabric** command is limited to displaying 16,384 entries. If you have a large system configuration that exceeds these limits you must filter the output (for example, by node or node port) to view all fabric login records.

An invocation example by using a delimiter

```
lsfabric -delim :
```

The resulting output, in which each row of output contains the following colon-separated columns:

```
remote_wwpn:remote_nportid:id:node_name:local_wwpn:
local_port:local_nportid:state:name:cluster_name:type
```

An invocation example for a WWPN being used by a SAN Volume Controller node

```
lsfabric wwpn port
```

The resulting output:

remote_wwpn name	remote_nportid cluster_name	id type	node_name	local_wwpn	local_port	local_nportid	state
5005076801305160	011B00	1	node1	500507680140506A	1	011600	active
node1	def110774	node					
10000000C95A01E7	011C00	1	node1	500507680130506A	2	011700	
active		nas					

An invocation example that shows unused (because the system's mask settings are blocked) node logins

```
lsfabric -delim :
```

The resulting output:

```
remote_wwpn:remote_nportid:id:node_name:local_wwpn:local_port:local_nportid:state:name:cluster_name:type
500507680304D190:021700:5:nodeA:500507680304A100:1:020300:active:node4:Cluster_9.115.2:node

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

[chnodebootdrive](#)

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

[chnodehw \(SVC\) / chnodecanisterhw \(Storwize family products\)](#)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

[chquorum](#)

Use the **chquorum** command to change the quorum association.

[chsecurity](#)

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

[chsite](#)

Use the **chsite** command to change the site name.

[chsra](#)

Use the **chsra** command to configure support assistance.

[chsystem](#)

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

[chsystemcert](#)

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

[chsystemip](#)

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

[chsystemethernet](#)

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

[chthrottle](#)

Use the **chthrottle** command to change attributes associated with a specified throttle object.

[cleardumps](#)

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

[cpdumps](#)

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

[detectiscsistorageportcandidate](#)

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

[dumpconfig](#) (Discontinued)

Attention: The **dumpconfig** command is discontinued.

[help](#)

Use the **help** (or **man**) command to display help information for system commands.

[lsclustercandidate](#) (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

[lscluster](#) (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

[lsclusterip](#) (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

[lsclusterstats](#) (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

ls_timezone

Use the **ls_timezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **set_timezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

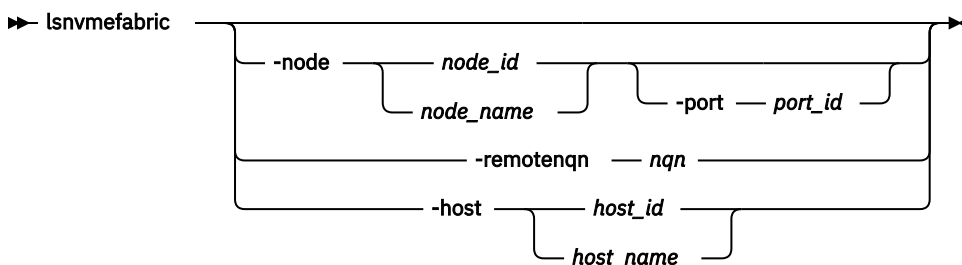

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

Syntax

Parameters

-node node_name | node_id

(Optional) Displays the output for all ports for the specified node. The only parameter that you can specify with the **-node** parameter is the **-port** parameter.

-port port_id

(Optional) Displays a concise view of all NQNs that are logged into the specified port ID and node. The **-port** parameter must be specified with only the **-node** parameter. A valid *port_id* value is from a minimum of 1 through a maximum equal to the number of node Fibre Channel (FC) ports.

-remotenqn nqn

(Optional) Displays a list of all logins from or to the specified remote NQN. You cannot use the **-remotenqn** parameter with any other parameter.

-host host_id | host_name

(Optional) Specifies a host name or ID. Issuing the **lsnvmefabric** command with the **-host** parameter is equivalent to issuing the **lsnvmefabric** command for every configured NQN of the specified host. You cannot use the **-host** parameter with any other parameter.

Description

The **lsnvmefabric** command displays NVMe logins from configured hosts.

This table provides the attribute values that can be displayed as output view data.

Table 34. lsnvmefabric output	
Attribute	Description
remote_nqn	Indicates the remote NQN of the login.

Table 34. **lsnvmefabric** output (continued)

Attribute	Description
node_id	Indicates the node ID on which the login is established.
node_name	Indicates the node name on which the login is established.
port_id	The node port ID that indicates the NVMe port that is displayed by the lstargetportfc view with the same port_id field.
state	Indicates whether a login is active or inactive . <ul style="list-style-type: none"> active - NVMe commands were issued within the last 5 minutes. inactive - No transactions completed within the last 5 minutes. Note: It might take up to 5 minutes after a command is issued for a host port to change from inactive to active .
object_type	The type of object to which the login belongs to.
object_name	The name of the object to which the login belongs to.

A concise invocation example

```
lsnvmefabric
```

The detailed resulting output:

```
remote_nqn                                node_id node_name
port_id state object_type object_name
nqn.2014-08.org.nvmexpress:NVMf:uuid:644f51bf-8432-4f59-bb13-5ada20c06395 1      node1
1      active host      host0
nqn.2014-08.org.nvmexpress:NVMf:uuid:644f51bf-8432-4f59-bb13-5ada20c06395 1      node1
2      active host      host0
nqn.2014-08.org.nvmexpress:NVMf:uuid:644f51bf-8432-4f59-bb13-5ada20c06395 2      node2
1      active host      host0
nqn.2014-08.org.nvmexpress:NVMf:uuid:644f51bf-8432-4f59-bb13-5ada20c06395 2      node2
2      active host      host0
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chscsiportauth

Use the **chscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrpghost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

[rmnode \(SVC\) / rmnodecanister \(Storwize family products\)](#)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

[rmportip](#)

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

[rmthrottle](#)

Use the **rmthrottle** command to remove the throttle object associated with any volume.

[setclustertime \(Discontinued\)](#)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

[setsystemtime](#)

Use the **setsystemtime** command to set the time for the system.

[setpwdreset](#)

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

[settimezone](#)

Use the **settimezone** command to set the time zone for the system.

[showtimezone](#)

Use the **showtimezone** command to display the current time zone settings for the cluster.

[startstats](#)

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

[stopstats \(Deprecated\)](#)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

[stopcluster \(Discontinued\)](#)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

[stopsystem](#)

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

[swapnode](#)

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

Syntax

►► **lsfcportcandidate** 

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

Description

This command returns a list of unconfigured, logged in FC ports.

Note: The **lsfcportcandidate** command presents a list of host FC ports that are logged in to nodes. However, there are situations when the information that is presented might include host FC ports that are no longer logged in or even part of the SAN fabric. For example, if a host FC port is unplugged from a switch but **lsfcportcandidate** shows the worldwide port name (WWPN) that is logged in to all nodes, the incorrect entry is removed when another device is plugged in to the same switch port that previously contained the removed host FC port.

Table 35 on page 443 shows the possible output:

Table 35. <i>lsfcportcandidate</i> output	
Attribute	Description
fc_WWPN	Indicates that the FC WWPN is logged in but unconfigured (not assigned to a host). This value must be 16 hexadecimal characters.

An invocation example

```
lsfcportcandidate
```

The resulting output:

```
fc_WWPN
200600A0B813B7AC
200600A0B813B7AD
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

Syntax

➤ **lsiscsiportauth** 

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

Description

This table shows the possible output:

Table 36. <i>lsiscsiportauth</i> output	
Attribute	Description
io_grp	Displays the I/O group of the node. This value is a number in the range of 0 to 4.
position	Displays the position of the node in the I/O group. This value is either 0 or 1.
src_port_id	Displays the local Ethernet port ID of the node. This value is a number in the range of 1 to 16.
iqn	Displays the iSCSI Qualified Name (IQN) to be mandated by IBM Cloud for connecting to the storage that uses this initiator port. This value is an alphanumeric with a maximum of 256 characters.
username	Displays the username to be mandated by IBM Cloud for connecting to the storage that uses this initiator port. This value is an alphanumeric with a maximum of 32 characters.

An invocation example with two nodes in I/O group 0 having two Ethernet ports each for which the user set the authentication details.

```
lsiscsiportauth
```

The resulting output:

```
io_grp  position  src_port_id  iqn                                username
0        0        1            iqn.1986-1:in.ibm.com:storage1    Mandrake4
0        0        2            iqn.1986-1:in.ibm.com:storage2    Magician3
0        1        1            iqn.1986-1:in.ibm.com:storage3    Magician2
0        1        2            iqn.1986-1:in.ibm.com:storage4    Magician1
```

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/ **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If no data is displayed, headings are not displayed.

-filtervalue attribute=value

(Optional) Specifies a list of one or more filters. Only objects with a value that matches the filter attribute value are displayed.

Note: Some filters allow the use of a wildcard when you enter the command. The following rules apply to the use of wildcards:

- The wildcard character is the asterisk (*).
- The command can contain a maximum of one wildcard.
- When you use a wildcard, enclose the filter entry within double quotation marks (""):
`lsiscsistorageport -filtervalue id="1*"`

-filtervalue?

(Optional) Displays the valid filter attributes for the **-filtervalue** parameter:

- id
- status

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

row_id

(Optional) Specifies the row ID view. The ID denotes sessions that are established from the specified initiator node ports to a backend controller target iSCSI qualified name (IQN) through a target Internet Protocol (IP) address. The value must be a number 0 - 1024.

Description

This command displays the details of sessions that are established from the initiator's iSCSI source ports to iSCSI backend target controller ports.

This table provides the attribute values that can be displayed as output view data.

<i>Table 37. lsiscsistorageport output</i>	
Attribute	Description
id	Indicates the object identifier for any sessions from any system nodes to the iSCSI backend controller iSCSI qualified name (IQN) through an iSCSI backend controller target IP. The value must be a number 0 - 1023.
src_port_id	Indicates the source port identifier for the node Ethernet port number that is displayed in the lsportip output. The value is a number 0 - 7.
target_ipv4	Indicates the IPv4 address of the iSCSI backend controller target port that establishes a session from the initiator source port that is identified by the source port ID. The default value is blank.
target_ipv6	Indicates the IPv6 address of the iSCSI backend controller target port that establishes a session from the initiator source port that is identified by the source port ID. The default value is blank.
target_iscsiname	Indicates the IQN of the iSCSI backend controller target that establishes a session. The value must be an alphanumeric string of no more than 256 characters. The default value is blank.
controller_id	Indicates the controller ID that is displayed in the lscontroller output. The value must be a number 0 - 1023. The default value is 1024.
iogroup_list	<p>Indicates a colon-separated list of discovery result codes: The value must be an alphanumeric string of up to 32 characters. This field cannot be blank. The values are 0 and 1.</p> <ul style="list-style-type: none"> • 0 indicates that the I/O group is available in the system, but discovery is either not triggered through the I/O group or discovery through the I/O group fails. • 1 indicates that the I/O group is present and discovery is successful through the I/O group. <p>Note: The value - (dash) indicates that the I/O group is not valid or is not present in the system.</p>
status	<p>Indicates the connectivity status from all nodes in the system to the target port.</p> <ul style="list-style-type: none"> • full If you specify a single I/O group by using the addiscsistorageport command and you establish the session from all nodes in the specified I/O group, the status is full. • partial If you specify a single I/O group by using the addiscsistorageport command and you establish the session from a single node in the specified I/O group, the status is partial. • none If you specify a single I/O group by using the addiscsistorageport command and you do not establish the session from any node in the specified I/O group, the status is none. <p>No default value exists. This field cannot be blank.</p>
connected	Indicates whether the established connection is from a specified Ethernet port of a target IQN and IP address. The values are yes and no.

Table 37. <i>lsscsistorageport</i> output (continued)	
Attribute	Description
site_id	Indicates the site ID (if the nodes that are being discovered belong to a site). This parameter applies to stretched and HyperSwap systems.
site_name	Indicates the site name (if the nodes that are being discovered belong to a site). This parameter applies to stretched and HyperSwap systems.
node_id	Indicates the node ID of the initiator node that establishes the session. The value must be a numeric value.
node_name	Indicates the node name of the initiator node that establishes the session. The value must be an alphanumeric string of no more than 16 characters. The default value is blank.
src_ipv4	Indicates the IPv4 IP address of the source port ID on a specified node. The default value is blank.
src_ipv6	Indicates the IPv6 IP address of the source port ID on a specified node. The default value is blank.
src_iscsiname	Indicates the IQN of the source node for which connectivity is being displayed for the target port. The value must be an alphanumeric string of no more than 256 characters. The default value is blank.

Before you specify **lsscsistorageport** such as in the following examples, you must use this procedure.

1. Complete target discovery by using an IPv4 IP address of a target iSCSI controller through source port ID 0.

```
detectiscsistorageportcandidate -targetip IP1 -srcportid 2
```

2. You would then specify session establishment by using **addiscsistorageport** for discovery output row 0 through I/O group 1.

```
addiscsistorageport -iogrp 1 0
```

3. Specify **lsscsistorageport** to view the output (no *tgt_user_name* or *target_chap* is required for discovery or session establishment).

Specify **rmiscsistorageport** to remove a session.

A concise invocation example

```
lsscsistorageport
```

The resulting output

```
id src_port_id target_ipv4 target_ipv6 target_iscsiname controller_id
controller_name iogroup_list status site_id site_name
0 4 192.168.82.90 iqn.1986-03.com.ibm:2145.temp.node1 3
controller3 0:1::- partial
```

A detailed invocation example

```
lsscsistorageport 0
```

The resulting output

```
id 0
src_port_id 4
target_ipv4 192.168.82.90
target_ipv6
target_iscsiname iqn.1986-03.com.ibm:2145.temp.node1
controller_id 0

Related reference

[addnode](#) (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster](#) (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrpghost

Use the **lsiogrpghost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If no data is available to be displayed, headings are not displayed.

-node *node_name* / *node_id*

(Optional)

Specifies the ID or name of a node in the system. The value must be an alphanumeric string.

-delim *delimiter*

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

lsiscsistorageportcandidate-rowid

(Optional) Specifies a row ID shown in the concise view to provide a detailed view of information about discovered portal IPs.

Description

This command lists information about the last invocation of the **detectiscsistorageportcandidate** command. This command can also display two types of lists:

- A concise list of information about the candidate iSCSI target controller IQNs that are visible at the specified target IP from the specified initiator ports along with indication of which initiator ports can see each discovered iSCSI target IQN.
- The detailed information about all the Target Controller Portal IPs discovered during the last invocation of the **detectiscsistorageportcandidate** command.

This table provides the attribute values that can be displayed as output view data.

Table 38. <i>lsiscsistorageportcandidate</i> output	
Attribute	Description
id	Indicates the row ID for the discovery output. Enter the detectiscsistorageportcandidate command before you use the lsiscsistorageportcandidate command. Display the concise view first to show one row per IQN. Use a row ID from the concise view to specify the detailed view of the lsiscsistorageportcandidate <i>lsiscsistorageportcandidate-rowid</i> command. The detailed view displays the list of discovered target IP addresses for the IQN.
src_port_id	Indicates the source port ID. The value is a number 1 - 8.
target_ipv4	Indicates the target IPv4 address.
target_ipv6	Indicates the target IPv6 address.
target_iscsiname	Indicates the (discovered) IQN that uses the target controller. The value is an alphanumeric string that is 256 characters long.

Table 38. <i>lsiscsistorageportcandidate</i> output (continued)	
Attribute	Description
iogroup_list	<p>Indicates a colon-separated list of discovery result codes: The value must be an alphanumeric string of up to 32 characters. This field cannot be blank. The values are 0 and 1:</p> <ul style="list-style-type: none"> • 0 indicates that the I/O group is available in the system, but discovery is either not triggered through the I/O group or discovery through the I/O group fails. • 1 indicates that the I/O group is present and discovery is successful through the I/O group. <p>Note: The value - (dash) indicates that the I/O group is not valid or is not present in the system.</p>
status	<p>Indicates whether discovery was successful. The status is one of the following values:</p> <ul style="list-style-type: none"> • full • partial • none
configured	Indicates whether the discovered target IQN has any established sessions with source ports or target ports. The values are yes and no (default).
site_id	Indicates the site ID (if the nodes that are being discovered belong to a site). This attribute applies to stretched and HyperSwap systems.
site_name	Indicates the site name (if the nodes that are being discovered belong to a site). This attribute applies to stretched and HyperSwap systems.

A concise invocation example

First, you must specify target discovery by using an IPv4 IP address for a target iSCSI controller through the source port ID 1. No *tgt_user_name* or *target_chap* value is required.

```
detectiscsistorageportcandidate -srcportid 1 -targetip 10.10.10.1
```

To view the output, specify the following command:

```
lsiscsistorageportcandidate
```

The following concise resulting output is displayed:

```
id  src_port_id target_ipv4 target_ipv6 target_iscsiname  iogroup_list configured status
site_id site_name
0   1           10.10.10.1           IQN1           1:1:1:1       no          Full
```

A concise invocation example

This example shows target discovery by using an IPv4 IP address for a target iSCSI controller through I/O group 0 and source port ID 0:

```
detectiscsistorageportcandidate -iogrp 0 -srcportid 1 -targetip IP2 -username superuser -
chapsecret password2
```

A *tgt_user_name* and *target_chap* value are used. This system has only two I/O groups, 0 and 3.

To view the output, specify the following command:

```
lsscsistorageportcandidate
```

The following concise resulting output is displayed:

id	src_port_id	target_ip4	target_ip6	target_iscsiname	iogroup_list	configured	status
site_id	site_name						
0	1	IP2		IQN1	1:-:-:0	no	Full
1	1	IP2		IQN2	1:-:-:0	no	Full
2	1	IP2		IQN3	1:-:-:0	no	Full

A detailed invocation example

First, you must specify target discovery by using an IPv4 IP address for a target iSCSI controller through the source port ID 1 and a target IP address.

```
detectiscsistorageportcandidate -srcportid 1 -targetip 10.10.10.1
```

The concise view has one row per IQN as shown in the first concise view example. Each row ID from the concise view identifies an iSCSI qualified name (IQN). To view detailed information for the IQN, specify the row ID (id):

```
lsscsistorageportcandidate 0
```

The resulting output lists details of the discovered portal IP addresses for the IQN:

```
SendTargets Portal IPs
10.10.10.1
10.10.10.2
fe:65::00:01
fe:65::00:02
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode** / **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

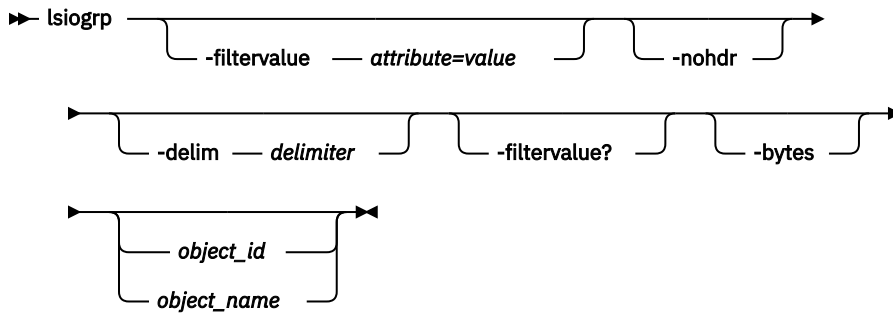

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

The list report style can be used to obtain the following two styles of report:

- A list that contains concise information about all the I/O groups that are visible to the system. Each entry in the list corresponds to a single I/O group.
- The detailed information about a single I/O group.

Syntax

Parameters

-filtervalue attribute=value

(Optional) Specifies a list of one or more filters. Only objects with a value that matches the filter attribute value are returned. If a capacity is specified, the units must also be included.

Note: Some filters allow the use of a wildcard when you enter the command. The following rules apply to the use of wildcard characters when you use the CLI:

- The wildcard character is an asterisk (*), which must be the first or last character in the string.
- The command can contain a maximum of one wildcard.
- When you use a wildcard, enclose the filter entry within double quotation marks (""), as follows:
– `lsiogrp -filtervalue "name=md★"`

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter `-delim :` on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

-filtervalue?

(Optional) Displays the valid filter attributes for the **lsiogrp** command.

-bytes

(Optional) Displays all capacities as bytes.

object_id / object_name

(Optional) Specifies the name or ID of an object. When you use this parameter, the detailed view of the specific object is returned and any value that is specified by the **-filtervalue** parameter is ignored. If you do not specify the **object_id / object_name** parameter, the concise view of all objects that match the filtering requirements that are specified by the **-filtervalue** parameter are displayed.

Description

This command returns a concise list or a detailed view of I/O groups visible to the system.

You can display the following information for this command:

id

Indicates the ID of the I/O group.

name

Indicates the name of the I/O group.

node_count

Indicates the number of nodes in the I/O group.

vdisk_count

Indicates the number of volumes in the I/O group.

host_count

Indicates the number of hosts in the I/O group.

flash_copy_total_memory

Indicates the total amount of memory that is allocated to FlashCopy.

flash_copy_free_memory

Indicates the total amount of memory that is allocated to FlashCopy, but unused.

remote_copy_total_memory

Indicates the total amount of memory that is allocated to Remote Copy, but unused. Remote copy includes Metro Mirror, Global Mirror, and HyperSwap.

remote_copy_free_memory

Indicates the total amount of memory that is allocated to Remote Copy, but unused. Remote copy includes Metro Mirror, Global Mirror, and HyperSwap.

mirroring_total_memory

Indicates the total amount of memory that is allocated to mirroring.

raid_total_memory

Indicates the total amount of memory that is allocated to RAID.

raid_free_memory

Indicates the total amount of memory that is allocated to RAID, but is unused.

maintenance

Indicates whether the I/O group is in maintenance mode. The values are:

- yes
- no

compression_active

Indicates whether Real-time compression is used in the selected I/O group.

accessible_vdisk_count

The number of accessible volumes in this I/O group.

compression_supported

Indicates whether the I/O group supports Real-time compression or data reduction compression.

max_enclosures

Indicates the maximum number of enclosures that are supported by this I/O group.

encryption_supported

Indicates whether the I/O group supports encryption for attached drives. The possible values are:

- yes
- no

flash_copy_maximum_memory

Identifies the maximum memory that can be set for the specified I/O group. The value must be a numeric string in the range 552 MB - 2048 MB.

site_id

Identifies the site ID for the I/O group. The possible values are:

- 1
- 2

site_name

Identifies the site name for the I/O group. The value must be an alphanumeric string or blank.

compression_total_memory

Indicates the total amount of memory that is allocated for Real-time compression per node in the specified I/O group.

fctargetportmode

Indicates the current N_Port ID Virtualization (NPIV) status in the specified I/O group. The values are:

- disabled
- transitional
- enabled
- changing_disabled_to_transitional
- changing_transitional_to_disabled
- changing_enabled_to_transitional
- changing_transitional_to_enabled

deduplication_supported

Indicates whether this I/O group supports data deduplication. The value that is displayed is either yes or no.

Note: An I/O group indicates that data deduplication is supported if the nodes in the I/O group have 32 GB of memory (or greater) installed. The existence of Real-time compression volumes in the I/O group does not influence whether data deduplication is shown as supported.

deduplication_active

Indicates whether data deduplication is in use in the I/O group. The value that is displayed is either yes or no.

nqn

The NVMe Qualified Name (NQN) presented by nodes in this I/O group. This field is blank if NVMe host attachment is not supported.

A concise invocation example

```
lsiogrp -delim :
```

The resulting output:

```
id:name:node_count:vdisk_count:host_count:site_id:site_name
0:io_grp0:1:0:0:1:chelsea1
1:io_grp1:0:0:0:2:chelsea2
2:io_grp2:0:0:0:3:chelsea1
3:io_grp3:0:0:0:4:chelsea1
4:recovery_io_grp:0:0:0:5:chelsea1
```

A detailed invocation example

```
lsiogrp -delim : 0
```

The detailed output:

```
id:0
name:io_grp0
node_count:1
vdisk_count:51
host_count:0
flash_copy_total_memory:3.0MB
flash_copy_free_memory:1.0MB
remote_copy_total_memory:6.5MB
remote_copy_free_memory:2.8MB
mirroring_total_memory:1.0MB
mirroring_free_memory:0.3MB
raid_total_memory:2MB
```

```
raid_free_memory:25.0MB
maintenance: no
compression_active:yes
accessible_vdisk_count:10
compression_supported:yes
max_enclosures:21
encryption_supported:yes
flash_copy_maximum_memory:2048.0MB
site_id:2
site_name:chelsea2
compression_total_memory:35128.0MB
fctargetportmode:disabled
deduplication_supported: yes
deduplication_active: no
nqn: nqn.1986-03.com.ibm:nvme:2145.000002006721FE4D.iogroup0
```

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

[chquorum](#)

Use the **chquorum** command to change the quorum association.

[chsecurity](#)

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

[chsite](#)

Use the **chsite** command to change the site name.

[chsr](#)

Use the **chsr** command to configure support assistance.

[chsystem](#)

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

[chsystemcert](#)

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

[chsystemip](#)

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

[chsystemethernet](#)

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

[chthrottle](#)

Use the **chthrottle** command to change attributes associated with a specified throttle object.

[cleardumps](#)

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

[cpdumps](#)

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

[detectiscsistorageportcandidate](#)

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

[dumpconfig \(Discontinued\)](#)

Attention: The **dumpconfig** command is discontinued.

[help](#)

Use the **help** (or **man**) command to display help information for system commands.

[lsclustercandidate \(Discontinued\)](#)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

[lscluster \(Discontinued\)](#)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

[lsclusterip \(Discontinued\)](#)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

ls_timezone

Use the **ls_timezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **set_timezone** command to set the time zone.

ls_sasportcandidate

Use the **ls_sasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

ls_security

Use the **ls_security** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

ls_site

Use the **ls_site** command to report the names of the sites.

ls_sra

Use the **ls_sra** command to check both secure remote assistance status and the time of the last login.

ls_throttle

Use the **ls_throttle** command to list throttle objects that are configured in the clustered system.

ls_system

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

Related reference

addnode (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

addiscsistorageport

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

cfgportip

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands.

All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

Isclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

Syntax

➤ **lsiogrphost** 

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

iogrp_id | iogrp_name

(Required) The ID or name of the I/O group for which a list of all mapped hosts is required.

Description

The **lsiogrphost** command displays a list of hosts that are mapped to a specified I/O group.

An invocation example

```
lsiogrphost -delim : 0
```

The resulting output:

```
id:name
0:hostzero
1:hostone
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

[chnodebootdrive](#)

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

[chnodehw \(SVC\) / chnodecanisterhw \(Storwize family products\)](#)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

ls_timezone

Use the **ls_timezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **set_timezone** command to set the time zone.

ls_sasportcandidate

Use the **ls_sasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

ls_security

Use the **ls_security** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

ls_site

Use the **ls_site** command to report the names of the sites.

ls_sra

Use the **ls_sra** command to check both secure remote assistance status and the time of the last login.

ls_throttle

Use the **ls_throttle** command to list throttle objects that are configured in the clustered system.

ls_system

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

Syntax

➤ **lsiogrpcandidate** 

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

Description

The **lsiogroupcandidate** command displays a list of I/O groups to which nodes can be added. Only the I/O group IDs are displayed.

An invocation example

```
lsiogrpcandidate
```

The resulting output:

```
id
0
1
2
3
4
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

[chnodebootdrive](#)

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

[chnodehw \(SVC\) / chnodecanisterhw \(Storwize family products\)](#)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

[chquorum](#)

Use the **chquorum** command to change the quorum association.

[chsecurity](#)

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsscsiportauth

Use the **lsscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsscsistorageport

Use the **lsscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsscsistorageportcandidate

Use the **lsscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

Related reference

addnode (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

addiscsistorageport

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

cfgportip

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrpghost

Use the **lsiogrpghost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezone

Use the **lstimezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

[showtimezone](#)

Use the **showtimezone** command to display the current time zone settings for the cluster.

[startstats](#)

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

[stopstats \(Deprecated\)](#)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

[stopcluster \(Discontinued\)](#)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

[stopsystem](#)

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

[swapnode](#)

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Parameters

-filtervalue attribute=value

(Optional) Specifies a list of one or more filters. Only objects with a value that matches the filter attribute value are returned. If a capacity is specified, the units must also be included.

Note: Some filters allow the use of a wildcard when you enter the command. The following rules apply to the use of wildcards with the Command-Line Interface (CLI):

- The wildcard character is an asterisk (*).
- The command can contain a maximum of one wildcard.
- When you use a wildcard, you must enclose the filter entry within double quotation marks (" "):

```
lsnode -filtervalue "name=md*"
```

-filtervalue?

Displays a list of valid filter attributes for the **-filtervalue attribute=value** parameter. The valid filters for the **lsnode** command are:

- canister_id
- config_node/config_nodecanister
- enclosure_id
- enclosure_serial_number
- hardware
- id
- iscsi_alias
- IO_group_name
- IO_group_id
- name
- panel_name
- status
- site_id

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

object_id / object_name

(Optional) Specifies the object ID or name. When you use this parameter, the detailed view of the specific object is returned and any value that is specified by the **-filtervalue** parameter is ignored. If you do not specify the **object_id / object_name** parameter, the concise view of all objects that match the filtering requirements that are specified by the **-filtervalue** parameter are displayed.

Description

This command returns a concise list or a detailed view of nodes or node canisters that are part of the system. This table provides the possible values that are applicable to the attributes that are displayed as data in the output views.

Table 39. <i>lsnode</i> or <i>lsnodecanister</i> attribute values	
Attribute	Value
status	Indicates the status. The values are: <ul style="list-style-type: none">• offline• service• flushing• pending• online• adding• deleting• spare• online_spare
config_node	Indicates if the node is a configuration node. The values are: <ul style="list-style-type: none">• yes• no
IO_group_id	Indicates the I/O group of the node. Note: A node that is considered a spare node does not use an I/O group ID for a node (spare or offline) that has been replaced by an online spare node.
IO_group_name	Indicates the name of the I/O group in the node. Note: A node that is considered a spare node does not use an I/O group name for a node (spare or offline) that has been replaced by an online spare node.
port_status	Indicates whether the node is a configuration node. The values are: <ul style="list-style-type: none">• active• inactive• not_installed
hardware	Indicates the hardware type (for example, DH8).
UPS_serial_number	Indicates the serial number of the UPS.
UPS_unique_id	Indicates the unique ID of the UPS.
panel_name	Indicates the unique identifier for the node.
enclosure_id	Blank. This field is blank for a node-based system.
canister_id	Blank. This field is blank for a node-based system.
enclosure_serial_number	Blank. This field is blank for a node-based system.

Table 39. **lsnode** or **lsnodecanister** attribute values (continued)

Attribute	Value
service_IP_mode	Indicates the current mode of the service IPv4 <ul style="list-style-type: none"> • Empty if IPv4 is not active • The values are: <ul style="list-style-type: none"> – static (if the service IP is set by the user) – dhcp (if the service IP is set successfully by using DHCP server) – dhcpfallback (if the service IP is set to a default value after a DHCP server request failed)
service_IP_mode_6	Indicates the current mode of the service IPv6 <ul style="list-style-type: none"> • Empty if IPv6 is not active • Either static (if the service IP is set by the user) or dhcp (if the service IP set successfully by using DHCP server).
site_id	Indicates the site node value.
site_name	Indicates the site name.
identify_LED	Indicates the node or node canister state - on, off, or blank.
product_mtm	Indicates the product machine type.
code_level	Indicates the current level of machine code that is running on the node. on, off, or blank.
serial_number	Indicates the current serial number for the node.
machine_signature	Indicates the current machine signature for the node.
update_complete	Indicates whether the node completes its update. The value is yes or no.
spare	Indicates whether the node is a spare. The value is yes or no.
failover_source	Indicates the node ID for a node that fails over to a specified node. This value is always blank if the node status is not online_spare.
protected_nodes	Indicates the nodes that might fail over to a specified node. The value is blank unless the node status is spare. Remember: This value does not indicate whether there is source node redundancy.

The first four Fibre Channel (FC) input/output (I/O) ports display the worldwide port name (WWPN), state, and speed. If there are less than four FC I/O ports, the fields display with a WWPN of 0000000000000000, port_status of inactive, and port_speed of N/A. To examine the FC ports, use the **lsportfc** command.

A node in the spare state displays a blank value for:

- IO_group_id
- IO_group_name
- partner_node_id
- partner_node_name.

A node with an online_spare state has a valid IO_group_id and IO_group_name, and might also have a valid partner_node_id and partner_node_name. The IO_group_id and IO_group_name values are blank when the node is in spare state.

Remember: Nodes that are in spare state or online_spare state must have a valid and unique node ID.

A concise invocation example for SAN Volume Controller

```
lsnode
```

The concise resulting output:

```

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its

own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

-battery *battery_id*

(Optional) Specifies the battery ID. If you specify this parameter, you must also specify *node*.

node

(Optional) Specifies the node ID or name.

Description

The command displays information about the batteries in a node. The concise view displays a line for each battery slot in all nodes.

This table provides the possible values that are applicable to the attributes that are displayed as data in the output views.

Table 40. <i>lsnodebattery</i> attribute values	
Attribute	Value
node_id	Identifies the node that contains the battery.
node_name	Identifies the node that contains the battery.
battery_id	Identifies the battery in the node.
status	<p>Identifies the status of the battery:</p> <ul style="list-style-type: none"> • online if the battery is present and working as usual (which includes a battery calibration). • degraded indicates that the battery is present but not working as usual (it has an error logged against it). • offline indicates that the battery cannot be detected or is failed (a node error indicating it is missing or failed is logged against the battery). <p>Remember: If the status is offline, all other fields display the most recent battery data. If no data was shown, all fields remain blank.</p>
charging_status	<p>Identifies the charging state of the battery:</p> <ul style="list-style-type: none"> • charged indicates that the battery is fully charged. • charging indicates that the battery is charging. • discharging indicates that the battery is losing voltage (life) and it is recalibrating the gas gauge after the battery recharges. • idle indicates that the battery is not charging and it is not discharging, but it is not fully charged. • reconditioning indicates that the battery is reconditioning itself by discharging and after recharging. <p>Important: Reconditioning occurs approximately every three months (on redundant systems) and can take from 12 - 48 hours.</p>
recondition_needed	Identifies that the battery needs to be reconditioned or it must start reconditioning soon. A recalibration is required because the reported values from the gas gauge are not trusted. The values are yes and no.
node_percentage_charge	Identifies the battery's percentage charged to determine if it can support the node.

Table 40. **lsnodebattery** attribute values (continued)

Attribute	Value
end_of_life_warning	Identifies the battery's end of life (with a warning noise). The values are yes and no. Important: Replace the battery.
present	Identifies a battery is present. The values are yes and no.
redundant	Identifies if it is safe to remove the battery. The values are yes and no.
remaining_charge_capacity_mAh	Identifies the remaining capacity of the battery (when the battery recharges) in milliamps hours (mAh).
full_charge_capacity_mAh	Identifies the fully charged capacity of the battery in mAh.
FRU_part_number	Identifies the FRU part number of the battery. The value contains seven alphanumeric characters.
FRU_identity	Identifies the 11S number (combining the manufacturing part number and the serial number). The value contains 22 alphanumeric characters.
compatibility_level	Identifies the battery driver software must support the current software level to operate with this battery (this comes from the battery vital product data or VPD).
last_recondition_timestamp	Indicates a system timestamp for the last successful recalibration of the gas gauge. The format is YYMMDDHHMMSS, where: <ul style="list-style-type: none"> • YY indicates year. • The first MM indicates month. • DD indicates day. • HH indicates hour. • The second MM indicates minute. • SS indicates second.
powered_on_hours	Indicates the number of hours the battery is in a powered node.
cycle_count	Identifies the number of charge or discharge cycles the battery performs.
error_sequence_number	Identifies the error log number of the highest priority error. This field is generally blank, but if the status is degraded or offline an error sequence number is displayed.

A concise invocation example

If battery 2 in node 1 is not installed:

```
lsnodebattery
```

The resulting output:

```
node_id node_name battery_id status charging_status recondition_needed node_percentage_charge
end_of_life_warning
1 node1 1 online charged no 50 no
1 node1 2 offline
2 node2 1 online charged no 50 no
2 node2 2 online reconditioning yes 50
```

A concise invocation example

If battery 2 in node 1 is failing to charge:

```
lsnodebattery
```

The resulting output:

node_id	node_name	battery_id	status	charging_status	recondition_needed	node_percentage_charge	
1	node1	1	online	charged	no	50	no
1	node1	2	offline	idle	no	50	no
2	node2	1	online	charged	no	100	no
2	node2	2	online	charged	no	100	

A concise invocation example

If battery 2 in node 1 is removed (last known status is presented):

```
lsnodebattery
```

The resulting output:

node_id	node_name	battery_id	status	charging_status	recondition_needed	node_percentage_charge	
1	node1	1	online	charged	no	50	no
1	node1	2	offline	charged	no	50	no
2	node2	1	online	charged	no	50	no
2	node2	2	online	reconditioning	yes	50	

A detailed invocation example

```
lsnodebattery -battery 2 2
```

The resulting output:

```
node_id 2
node_name node2
battery_id 2
status online
charging_status reconditioning
present yes
redundant yes
recondition_needed yes
remaining_charge_capacity_mAh 1600
full_charge_capacity_mAh 1950
end_of_life_warning no
FRU_part_number FRU0001
FRU_identity 11SYM30BG123456MAN0001
compatability_level 5
last_recondition_timestamp 0
powered_on_hours 12345
cycle_count 2
node_percentage_charge 50
error_sequence_number
```

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

cfgportip

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsr

Use the **chsr** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode** / **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister.

Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezone

Use the **lstimezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

-slot slot_id

(Optional) Valid only when a node or enclosure is specified. Gives detailed view for that node slot. If you specify **-slot**, you must also specify *node_name* or *node_id*.

node_name / *node_id*

(Optional) Identifies the node name or ID.

Description

The command displays information about the internal boot drives for nodes.

This table provides the possible values that are applicable to the attributes that are displayed as data in the output views.

Table 41. lsnodebootdrive attribute values	
Attribute	Value
node_id	Identifies the ID (in decimal format) of the node that contains the boot drive.
node_name	Identifies the name of node that contains the boot drive.
can_sync	Indicates whether synchronization is available. The values are yes, no, unknown
slot_id	Identifies the ID (in decimal format) of the slot within the node.

Table 41. <i>lsnodebootdrive</i> attribute values (continued)	
Attribute	Value
booted	Indicates whether the node started from the specified drive. The values are yes, no.
status	Indicates the slot status. The values are: <ul style="list-style-type: none"> • missing indicates that the slot must be occupied, but the software cannot detect a drive. It also indicates the serial number of the expected drive. • empty indicates that the slot must be empty and is empty. • unsupported indicates that the slot must to be empty but is not empty. • failed indicates that the drive in the slot is not working. • uninitialized indicates that the drive is not formatted for the system. • wrong_node indicates that the drive is working but is not in the correct node. It also indicates the serial number of the node the drive is in and might indicate the serial number of the drive in the slot. • wrong_slot indicates that the drive is working correctly - it is in the right node but the wrong slot. It also indicates which drives belong in which slots. • out_of_sync indicates that the drive is working correctly but must be resynchronized. • online indicates that the drive in the slot is working correctly. • unknown indicates that the node is not an active member of the system, and the state of the drive in that slot is unknown.
actual_drive_sn	Indicates the actual drive serial number.
configured_drive_sn	Indicates the configured drive serial number.
actual_node_sn	Identifies the serial number of the node the drive (currently in the slot) belongs in. The value is alphanumeric string or blank.
identify	Indicates if <code>chbootdrive -identify</code> is specified. The values are: <ul style="list-style-type: none"> • on indicates <code>chbootdrive -identify yes -slot</code> is specified • off indicates <code>chbootdrive -identify no -slot</code> is specified • N/A indicates that the drive slot cannot be identified.
FRU_part_number	Identifies the field-replaceable unit (FRU) part number of the drive. The value is a 7-character alphanumeric string or blank if there is none. The value is N/A if the drive is not supplied for your system.
FRU_identity	Identifies the 11S number that combines the manufacturing part number and serial number. The value is a 22-character alphanumeric string. The value is N/A if the drive is not supplied for your system.

A concise invocation example

In this example, `bfn1`, `bfn2`, `bfn3`, are online nodes and `bfn4` is an offline node.

```
lsnodebootdrive -delim ' '
```

The resulting output:

node_id	node_name	can_sync	slot_id	booted	status	actual_drive_sn	configured_drive_sn
actual_node_sn							
1	bfn1	no	1	yes	online	1234567	1234567

bfbfbf1							
1	bfn1	no	2	no	missing		1234568
1	bfn1	no	3		empty		
1	bfn1	no	4		empty		
1	bfn1	no	5		empty		
1	bfn1	no	6		empty		
1	bfn1	no	7		empty		
1	bfn1	no	8	no	unsupported	12BD345	
2	bfn2	no	1	yes	online	9234567	9234567
bfbfbf2							
2	bfn2	no	2	no	wrong_node	1234568	9234577
bfbfbf2							
3	bfn3	no	1	yes	online	3333333	3333333
bfbfbf3							
3	bfn3	yes	2	no	out_of_sync	3333334	3333334
bfbfbf3							
4	bfn4	unknown	1	yes	unknown	4444444	4444444
bfbfbf4							
4	bfn4	unknown	2	no	unknown	4444445	4444445
bfbfbf4							

A concise invocation example

```
lsnodebootdrive bfn4
```

The resulting output:

node_id	node_name	can_sync	slot_id	booted	status	actual_drive_sn	configured_drive_sn
actual_node_sn							
4	bfn4	unknown	1	yes	unknown	4444444	4444444
bfbfbf4							
4	bfn4	unknown	2	no	unknown	4444445	4444445
bfbfbf4							

A detailed invocation example

```
lsnodebootdrive -slot 1 bfn1
```

The resulting output:

```
node_id 1
node_name bfn1
can_sync no
slot_id 1
booted yes
status online
actual_drive_sn 1234567
configured_drive_sn 1234567
actual_node_sn bfbfbf1
identify off
FRU_part_number 90Y9998
FRU_identity 11S49Y7427YXXX6X
```

A detailed invocation example

```
lsnodebootdrive -slot 1 homer4
```

The resulting output:

```
node_id 4
node_name homer4
can_sync unknown
slot_id 1
booted yes
status unknown
actual_drive_sn 4444444
configured_drive_sn 4444444
actual_node_sn bfbfbf4
identify off
FRU_part_number 90Y9999
FRU_identity 11S49Y7427YXXX6Y
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

[chnodebootdrive](#)

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

[chnodehw \(SVC\) / chnodecanisterhw \(Storwize family products\)](#)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

[chquorum](#)

Use the **chquorum** command to change the quorum association.

[chsecurity](#)

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsscsiportauth

Use the **lsscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsscsistorageport

Use the **lsscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsscsistorageportcandidate

Use the **lsscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

Syntax

➔ **lsnodecandidate** 

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

-svcconfig

(Optional) Lists all nodes in the enclosure that are in a candidate state.

Description

Note: The **lsnodecandidate** command is a SAN Volume Controller command. For Storwize V7000, use the **lscontrolenclosurecandidate** command.

This command displays a list of nodes that are available to add to the clustered system. This list includes nodes that are not already part of a clustered system, but are compatible with the clustered system code level. Nodes with hardware types that are incompatible with the installed code are not listed.

This table describes the possible outputs:

Table 42. lsnodecandidate outputs	
Attribute	Description
panel_name	Unique identifier for the node.
UPS_serial_number	The serial number of the UPS.
UPS_unique_id	The unique ID of UPS.
hardware	Describes the type of nodes.

Table 42. *lsnodecandidate* outputs (continued)

Attribute	Description
serial_number	Indicates the current serial number for the node (7 characters).
product_mtm	Indicates the current product machine type for the node (8 characters with the hyphen).
machine_signature	Indicates the current machine signature for the node (16-character hexadecimal string with hyphens).

An invocation example

```
lsnodecandidate -delim :
```

The resulting output:

```
id:
panel_name:UPS_serial_number:UPS_unique_id:hardware:serial_number:product_mtm:machine_signature
1:146355:10L3ASH:202381001C0D18D8:8G4:78G0123:2145-DH8:0123-4567-89AB-CDEF
```

An invocation example

```
lsnodecandidate
```

The resulting output:

```
id          panel_name UPS_serial_number UPS_unique_id   hardware serial_number product_mtm
machine_signature
500507680C00003C KQ8FP4W          500507680C00003C DH8      KQ8FP4W      9846-AC1

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode** / **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

Syntax

Parameters

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

-history stat_list

(Optional) Provides the most recent node canister statistical values, specific canister statistical values, or historical data for any canister.

nodecanister_id | nodecanister_name

(Optional) Identifies the node canister for which you want to request statistics.

Description

This command returns a concise list or a detailed view of node canisters that are part of the clustered system. This table provides the possible values that are applicable to the attributes that are displayed as data in the output views.

Table 43. Node canister attribute values	
Attribute	Value
nodecanister_id	The ID of the node canister.
nodecanister_name	The name of the node canister.
stat_current	The current value of the statistic field.
stat_list	The system history of the reported statistics.
stat_name	The name of the statistic field.
stat_peak	The peak value of the statistic field in the last five minutes.
stat_peak_time	The time that the peak occurred.
sample_time	The time of the sample occurrence.
stat_value	The statistical value at the epoch interval.

Note: Filtering is supported on **nodecanister_id**, **nodecanister_name**, and **stat_name** fields by using the concise view.

The following table provides the possible values that are applicable to the values that are displayed for the **stat_name** attribute.

Table 44. Stat_name field values	
Value	Description
cpu_pc	The total percentage of CPU utilization for the system.
fc_mb	Displays the total number of megabytes transferred per second (MBps) for Fibre Channel traffic on the system. This value includes host I/O and any bandwidth that is used for communication within the system.
fc_io	Displays the total input/output (I/O) operations that are transferred per seconds for Fibre Channel traffic on the system. This value includes host I/O and any bandwidth that is used for communication within the system.

Table 44. **Stat_name** field values (continued)

Value	Description
sas_mb	Displays the total number of megabytes transferred per second (MBps) for serial-attached SCSI (SAS) traffic on the system. This value includes host I/O and bandwidth that is used for background RAID activity.
sas_io	Displays the total I/O operations that are transferred per second for SAS traffic on the system. This value includes host I/O and bandwidth that is used for background RAID activity.
iscsi_mb	Displays the total number of megabytes transferred per second (MBps) for iSCSI traffic on the system.
iscsi_io	Displays the total I/O operations that are transferred per second for iSCSI traffic on the system.
write_cache_pc	Displays the percentage of the write cache usage for the node.
total_cache_pc	Displays the total percentage for both the write and read cache usage for the node.
vdisk_mb	Displays the average number of megabytes transferred per second (MBps) for read and write operations to volumes during the sample period.
vdisk_io	Displays the average amount of I/O operations that are transferred per second for read and write operations to volumes during the sample period.
vdisk_ms	Displays the average amount of time in milliseconds that the system takes to respond to read and write requests to volumes over the sample period.
mdisk_mb	Displays the average number of megabytes transferred per second (MBps) for read and write operations to MDisks during the sample period.
mdisk_io	Displays the average amount of I/O operations that are transferred per second for read and write operations to MDisks during the sample period.
mdisk_ms	Displays the average amount of time in milliseconds that the system takes to respond to read and write requests to MDisks over the sample period.
drive_mb	Displays the average number of megabytes transferred per second (MBps) for read and write operations to drives during the sample period.
drive_io	Displays the average amount of I/O operations that are transferred per second for read and write operations to drives during the sample period.
drive_ms	Displays the average amount of time in milliseconds that the system takes to respond to read and write requests to drives over the sample period.
vdisk_w_mb	Displays the average number of megabytes transferred per second (MBps) for read and write operations to volumes during the sample period.
vdisk_w_io	Displays the average amount of I/O operations that are transferred per second for write operations to volumes during the sample period.
vdisk_w_ms	Displays the average amount of time in milliseconds that the system takes to respond to write requests to volumes over the sample period.
mdisk_w_mb	Displays the average number of megabytes transferred per second (MBps) for write operations to MDisks during the sample period.
mdisk_w_io	Displays the average amount of I/O operations that are transferred per second for write operations to MDisks during the sample period.

Table 44. **Stat_name** field values (continued)

Value	Description
mdisk_w_ms	Displays the average amount of time in milliseconds that the system takes to respond to write requests to MDisks over the sample period.
drive_w_mb	Displays the average number of megabytes transferred per second (MBps) for write operations to drives during the sample period.
drive_w_io	Displays the average amount of I/O operations that are transferred per second for write operations to drives during the sample period.
drive_w_ms	Displays the average amount of time in milliseconds that the system takes to respond write requests to drives over the sample period.
vdisk_r_mb	Displays the average number of megabytes transferred per second (MBps) for read operations to volumes during the sample period.
vdisk_r_io	Displays the average amount of I/O operations that are transferred per second for read operations to volumes during the sample period.
vdisk_r_ms	Displays the average amount of time in milliseconds that the system takes to respond to read requests to volumes over the sample period.
mdisk_r_mb	Displays the average number of megabytes transferred per second (MBps) for read operations to MDisks during the sample period.
mdisk_r_io	Displays the average amount of I/O operations that are transferred per second for read operations to MDisks during the sample period.
mdisk_r_ms	Displays the average amount of time in milliseconds that the system takes to respond to read requests to MDisks over the sample period.
drive_r_mb	Displays the average number of megabytes transferred per second (MBps) for read operations to drives during the sample period
drive_r_io	Displays the average amount of I/O operations that are transferred per second for read operations to drives during the sample period.
drive_r_ms	Displays the average amount of time in milliseconds that the system takes to respond to read requests to drives over the sample period.
iplink_mb	The total number of megabytes transferred per second (MBps) for Internet Protocol (IP) replication traffic on the system. This value does not include iSCSI host input/output (I/O) operations.
iplink_comp_mb	Displays the average number of compressed megabytes transferred per second (MBps) over the IP replication link during the sample period.
iplink_io	The total input/output (I/O) operations that are transferred per second for IP partnership traffic on the system. This value does not include Internet Small Computer System Interface (iSCSI) host I/O operations.
iser_io	Displays the total I/O operations that are transferred per second for iSER traffic on the system.
iser_mb	Displays the total number of megabytes transferred per second (MBps) for iSER traffic on the system.

Output from the lsnodecanisterstats example

node_id	node_name	stat_name	stat_current	stat_peak	stat_peak_time

A node-based, filtered invocation example

```
lsnodecanisterstats -filtervalue stat_name=sas_io:stat_name=sas_mb node1
```

The node-based filtered example resulting output:

node_id	node_name	stat_name	stat_current	stat_peak	stat_peak_time
1	node1	sas_mb	212	421	111123105840
1	node1	sas_io	2477	4184	111123105840

Historical view that can list multiple statistics and requires a node-based invocation

```
lsnodecanisterstats -history cpu_pc:fc_mb:sas_mb node1
```

The historical invocation resulting output:

node_id	node_name	sample_time	stat_name	stat_value
2	node2	111123105839	cpu_pc	6
2	node2	111123105844	cpu_pc	5

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrpghost

Use the **lsiogrpghost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lsptimezones

Use the **lsptimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

Related reference

addnode (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

addiscsistorageport

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

cfgportip

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw / lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats / lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd / lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setssystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter `-delim :` on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

object_id / object_name

(Required) Specifies the object name or ID.

Description

This table provides the possible values that are applicable to the attributes that are displayed as data in the output views.

Table 45. Attribute values for lsnodehw and lsnodecanisterhw	
Attribute	Value
id	Indicates the node or node canister unique ID.
name	Indicates the node or node canister name.
status	Indicates the node or node canister status.
IO_group_id	Indicates the input/output (I/O) group ID.
IO_group_name	Indicates the I/O group name.
hardware	Indicates the hardware model, such as DH8.
actual_different	Indicates whether the node or node canister hardware is different from the configured hardware.
actual_valid	Indicates whether the node or node canister hardware is valid.
memory_configured	Indicates the configured amount of memory (in GB).
memory_actual	Indicates the currently installed amount of memory (in GB).
memory_valid	Indicates whether the actual memory is a valid configuration.
cpu_count	Indicates the maximum number of CPUs for the node.
cpu_socket	Indicates the ID of socket the CPU fields refer to.
cpu_configured	Indicates the configured CPU for this socket.
cpu_actual	Indicates the currently installed CPU in this socket.
cpu_valid	Indicates whether the currently installed CPU is a valid configuration.
adapter_count	Indicates the maximum number of adapters for the node (differs by node type).
adapter_location	Indicates the location of this adapter.
adapter_configured	Indicates the configured adapter for this location.
adapter_actual	Indicates the currently installed adapter for this location.
adapter_valid	Indicates whether the adapter in this location is valid.
ports_different	Indicates whether the current hardware is able to provide more I/O ports? The values are yes and no.
node_usb	Indicates whether the USB ports are enabled for use (on) or disabled (off). This field might not apply to your system.

An invocation example for Storwize V7000

```
lsnodecanisterhw 1
```

The resulting output

```
id,1
name,h1cn114289
status,online
IO_group_id,0
IO_group_name,io_grp0
```

Related reference**addnode** (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

addiscsistorageport

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

cfgportip

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / **chnodecanisterhw** (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

[chsite](#)

Use the **chsite** command to change the site name.

[chsra](#)

Use the **chsra** command to configure support assistance.

[chsystem](#)

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

[chsystemcert](#)

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

[chsystemip](#)

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

[chsystemethernet](#)

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

[chthrottle](#)

Use the **chthrottle** command to change attributes associated with a specified throttle object.

[cleardumps](#)

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

[cpdumps](#)

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

[detectiscsistorageportcandidate](#)

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

[dumpconfig](#) (Discontinued)

Attention: The **dumpconfig** command is discontinued.

[help](#)

Use the **help** (or **man**) command to display help information for system commands.

[lsclustercandidate](#) (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

[lscluster](#) (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

[lsclusterip](#) (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

[lsclusterstats](#) (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

[lsdiscoverystatus](#)

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

[lsfabric](#)

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lscsiportauth

Use the **lscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lscsisstorageport

Use the **lscsisstorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lscsisstorageportcandidate

Use the **lscsisstorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

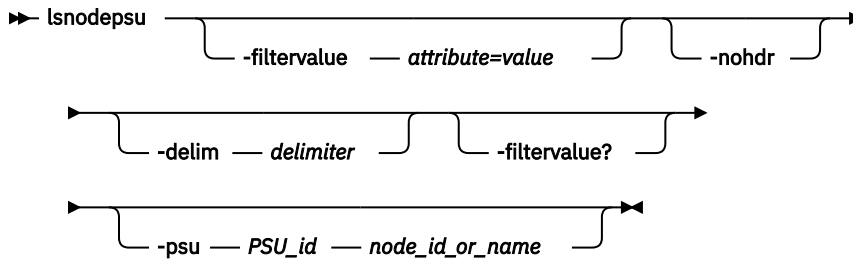

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

Syntax

Parameters

-filtervalue attribute=value

(Optional) Specifies a list of one or more filters. Only objects with a value that matches the filter attribute value are returned. If a capacity is specified, the units must also be included.

Note: Some filters allow the use of a wildcard when you enter the command. The following rules apply to the use of wildcards with the Command-Line Interface (CLI):

- The wildcard character is an asterisk (*).
- The command can contain a maximum of one wildcard.
- When you use a wildcard, you must enclose the filter entry within double quotation marks (" "):

```
lsnode -filtervalue "name=md*"
```

-filtervalue?

Displays a list of valid filter attributes for the **-filtervalue attribute=value** parameter. The valid filters for the **lsnodepsu** command are:

- PSU_id
- node_id
- node_name
- status

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed the data is separated from the header by a space. The -

delim parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

-psu PSU_id

(Optional) Specifies the ID of the PSU. You must specify a **node_id** or **node_name** if you use the **-psu** parameter.

node_id / node_name

(Optional) Specifies the node ID or node name (as listed in the **lsnode** command).

Description

This table provides the possible values that are applicable to the attributes that are displayed as data in the output views.

Table 46. Attribute values for lsnodepsu	
Attribute	Value
node_id	Indicates the ID, as shown in lsnode , of the node in which the PSU is located.
node_name	Indicates the name, as shown in lsnode , of the node in which the PSU is located.
PSU_id	Indicates the ID of the PSU.
status	Indicates the overall status of the PSU. The possible values are: <ul style="list-style-type: none"> • offline • online • degraded • unknown
input_failed	Indicates the state of the input failed LED on the PSU. The value is either on or off .
output_failed	Indicates the state of the output failed LED on the PSU. The value is either on or off .
fan_failed	Indicates the state of the fan failed LED on the PSU. The value is either on or off .
swapped	Indicates whether the PSU has been swapped since power-on or the last clear swap. The value is either yes or no .
redundant	Indicates whether the PSU is redundant. The value is either yes or no .
FRU_part_number	Indicates FRU part number of the PSU. The value is an ASCII string up to 22 characters.
FRU_identity	Indicates FRU identity of the PSU. The value is an ASCII string up to 22 characters.
firmware_level_1	Indicates the firmware level of the PSU. The value is an ASCII string up to 22 characters.

An invocation example

```
lsnodepsu
```

The resulting output:

node_id	node_name	PSU_id	status
3	tetra3	1	online
3	tetra3	2	online
2	tetra2	1	online
2	tetra2	2	online

An invocation example

```
lsnodepsu -gui
```

The resulting output:

node_id	node_name	PSU_id	status	input_failed	output_failed	fan_failed	swapped	redundant
FRU_part_number	FRU_identity	firmware_level_1						
3	tetra3	1	online	off	off	off	no	yes
01YM310		2021217J14T0489	1.0					
3	tetra3	2	online	off	off	off	no	yes
01YM310		2021217J14T0818	1.0					
2	tetra2	1	online	off	off	off	no	yes
01YM310		2021217J14T0763	1.0					
2	tetra2	2	online	off	off	off	no	yes
01YM310		2021217J14T0879	1.0					

An invocation example

```
lsnodepsu -gui -psu 1 2
```

The resulting output:

```
node_id tetra2
PSU_id 1
status online
input_failed off
output_failed off
fan_failed off
swapped no
redundant yes
FRU_part_number 01YM310
FRU_identity 2021217J14T0763
firmware_level_1 1.0
```

An invocation example

```
lsnodepsu -gui -psu 2 tetra3
```

The resulting output:

```
node_id tetra3
PSU_id 2
status online
input_failed off
output_failed off
fan_failed off
swapped no
redundant yes
FRU_part_number 01YM310
FRU_identity 2021217J14T0818
firmware_level_1 1.0
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is

not supported by the code, upgrade the system to a code version that supports the model type of the new node.

addiscsstorageport

Use the **addiscsstorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

cfgportip

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsstorageport

Use the **chiscsstorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrpghost

Use the **lsiogrpghost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lszones

Use the **lszones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

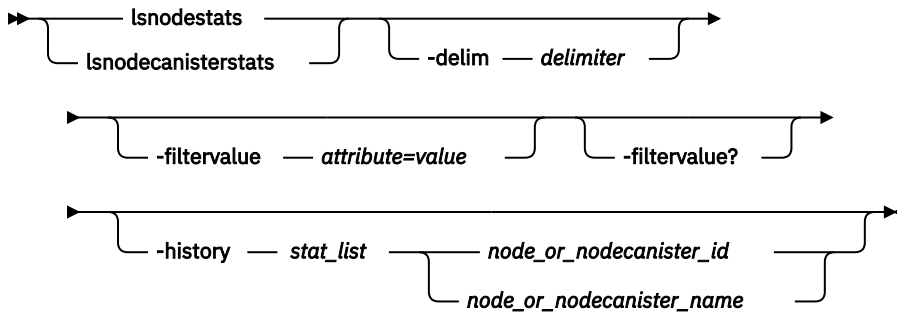

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

Syntax

Parameters

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view. (For example, the spacing of columns does not occur.) In a detailed view, the data is separated from its header by the specified delimiter.

-filtervalue attribute=value

(Optional) Specifies a list of one or more filters. Only objects with a value that matches the filter attribute value are displayed.

Note: Some filters allow the use of a wildcard when you enter the command. The following rules apply to the use of wildcards:

- The wildcard character is the asterisk (*).
- The command can contain a maximum of one wildcard.
- When you use a wildcard, enclose the filter entry within double quotation marks (""):

```
lsenclosurestats -filtervalue stat_name=temp_f
```

-filtervalue?

(Optional) Displays the valid filter attributes for the **-filtervalue attribute=value** parameter:

- node_id
- node_name
- stat_name

-history stat_list

(Optional) Provides a table of statistical values for the specified node. The *stat_list* is a colon-delimited list of one or more statistical values. A table is generated for each entry in the *stat_list*.

Remember: If **-history** is specified, a node ID or name must be specified as well.

node_or_nodecanister_id / node_or_nodecanister_name

(Optional) Identifies the node or node canister for which you want to request statistics.

Description

This command returns a concise list or a detailed view of nodes or node canisters that are part of the clustered system. This table provides the possible values that are applicable to the attributes that are displayed as data in the output views.

<i>Table 47. Attribute values for lsnodestats or lsnodecanister</i>	
Attribute	Value
node_id	The ID of the node or node canister.
node_name	The name of the node or node canister.
stat_current	The current value of the statistic field.
stat_list	The system history of the reported statistics. The list of statistics can contain multiple items that are separated by colons.
stat_name	The name of the statistic field. See Table 48 on page 573 for descriptions of available statistics.
stat_peak	The peak value of the statistic field in the last 5 minutes.
stat_peak_time	The time that the peak occurred.
sample_time	The time of the sample occurrence.
stat_value	The statistical value at the epoch interval.

Remember: Filtering is supported on the **stat_name** field by using the concise view.

The following table provides the possible values that are applicable to the values that are displayed for the **stat_name** attribute.

<i>Table 48. Stat_name field values</i>	
Value	Description
compression_cpu_pc	Displays the percentage of allocated CPU capacity that is utilized for compression.
cpu_pc	Displays the percentage of allocated CPU capacity that is utilized for the system.
fc_mb	Displays the total number of megabytes transferred per second for Fibre Channel traffic on the system. This value includes host I/O and any bandwidth that is used for communication within the system.
fc_io	Displays the total input/output (I/O) operations that are transferred per seconds for Fibre Channel traffic on the system. This value includes host I/O and any bandwidth that is used for communication within the system.
sas_mb	Displays the total number of megabytes transferred per second for serial-attached SCSI (SAS) traffic on the system. This value includes host I/O and bandwidth that is used for background RAID activity.
sas_io	Displays the total I/O operations that are transferred per second for SAS traffic on the system. This value includes host I/O and bandwidth that is used for background RAID activity.
iscsi_mb	Displays the total number of megabytes transferred per second for iSCSI traffic on the system.

Table 48. **Stat_name** field values (continued)

Value	Description
iscsi_io	Displays the total I/O operations that are transferred per second for iSCSI traffic on the system.
write_cache_pc	Displays the percentage of the write cache usage for the node.
total_cache_pc	Displays the total percentage for both the write and read cache usage for the node.
vdisk_mb	Displays the average number of megabytes transferred per second for read and write operations to volumes during the sample period.
vdisk_io	Displays the average number of I/O operations that are transferred per second for read and write operations to volumes during the sample period.
vdisk_ms	Displays the average amount of time in milliseconds that the system takes to respond to read and write requests to volumes over the sample period.
mdisk_mb	Displays the average number of megabytes transferred per second for read and write operations to MDisks during the sample period.
mdisk_io	Displays the average number of I/O operations that are transferred per second for read and write operations to MDisks during the sample period.
mdisk_ms	Displays the average amount of time in milliseconds that the system takes to respond to read and write requests to MDisks over the sample period.
drive_mb	Displays the average number of megabytes transferred per second for read and write operations to drives during the sample period.
drive_io	Displays the average number of I/O operations that are transferred per second for read and write operations to drives during the sample period.
drive_ms	Displays the average amount of time in milliseconds that the system takes to respond to read and write requests to drives over the sample period.
vdisk_w_mb	Displays the average number of megabytes transferred per second for read and write operations to volumes during the sample period.
vdisk_w_io	Displays the average number of I/O operations that are transferred per second for write operations to volumes during the sample period.
vdisk_w_ms	Displays the average amount of time in milliseconds that the system takes to respond to write requests to volumes over the sample period.
mdisk_w_mb	Displays the average number of megabytes transferred per second for write operations to MDisks during the sample period.
mdisk_w_io	Displays the average number of I/O operations that are transferred per second for write operations to MDisks during the sample period.
mdisk_w_ms	Displays the average amount of time in milliseconds that the system takes to respond to write requests to MDisks over the sample period.
drive_w_mb	Displays the average number of megabytes transferred per second for write operations to drives during the sample period.
drive_w_io	Displays the average number of I/O operations that are transferred per second for write operations to drives during the sample period.
drive_w_ms	Displays the average amount of time in milliseconds that the system takes to respond write requests to drives over the sample period.

Table 48. **Stat_name** field values (continued)

Value	Description
vdisk_r_mb	Displays the average number of megabytes transferred per second for read operations to volumes during the sample period.
vdisk_r_io	Displays the average number of I/O operations that are transferred per second for read operations to volumes during the sample period.
vdisk_r_ms	Displays the average amount of time in milliseconds that the system takes to respond to read requests to volumes over the sample period.
mdisk_r_mb	Displays the average number of megabytes transferred per second for read operations to MDisks during the sample period.
mdisk_r_io	Displays the average number of I/O operations that are transferred per second for read operations to MDisks during the sample period.
mdisk_r_ms	Displays the average amount of time in milliseconds that the system takes to respond to read requests to MDisks over the sample period.
drive_r_mb	Displays the average number of megabytes transferred per second for read operations to drives during the sample period
drive_r_io	Displays the average number of I/O operations that are transferred per second for read operations to drives during the sample period.
drive_r_ms	Displays the average amount of time in milliseconds that the system takes to respond to read requests to drives over the sample period.
iplink_mb	The total number of megabytes transferred per second for Internet Protocol (IP) replication traffic on the system. This value does not include iSCSI host input/output (I/O) operations.
iplink_comp_mb	Displays the average number of compressed megabytes transferred per second (MBps) over the IP replication link during the sample period.
iplink_io	The total input/output (I/O) operations that are transferred per second for IP partnership traffic on the system. This value does not include Internet Small Computer System Interface (iSCSI) host I/O operations.
cloud_up_mb	Displays the average number of megabits transferred per second (Mbps) for upload operations to a cloud account during the sample period.
cloud_up_ms	Displays the average amount of time (in milliseconds) it takes for the system to respond to upload requests to a cloud account during the sample period.
cloud_down_mb	Displays the average number of Mbps for download operations to a cloud account during the sample period.
cloud_down_ms	Displays the average amount of time (in milliseconds) it takes for the system to respond to download requests to a cloud account during the sample period.

An invocation example

```
lsnodestats
```

The resulting output:

node_id	node_name	stat_name	stat_current	stat_peak	stat_peak_time
1	node1	cpu_pc	5	9	111123105330
1	node1	fc_mb	218	238	111123105440
1	node1	fc_io	1122	1501	111123105435
1	node1	sas_mb	282	402	111123105335

1	node1	sas_io	3129	4427	111123105335
1	node1	iscsi_mb	0	0	111123105825

An invocation example of a node-based, filtered invocation

```
lsnodestats -filtervalue stat_name=sas_io:stat_name=sas_mb node1
```

The resulting output:

node_id	node_name	stat_name	stat_current	stat_peak	stat_peak_time
1	node1	sas_mb	212	421	111123105840
1	node1	sas_io	2477	4184	111123105840

An invocation example of an historical view that can list multiple statistics and requires a node-based invocation

```
lsnodestats -history cpu_pc:fc_mb:sas_mb node1
```

The resulting output:

node_id	node_name	sample_time	stat_name	stat_value
2	node2	111123105839	cpu_pc	6
2	node2	111123105844	cpu_pc	5
2	node2	111123105849	cpu_pc	5
2	node2	111123105854	cpu_pc	5
2	node2	111123105859	cpu_pc	6
2	node2	111123105904	cpu_pc	5
2	node2	111123105909	cpu_pc	5
2	node2	111123105914	cpu_pc	5
2	node2	111123105919	cpu_pc	5
2	node2	111123105924	cpu_pc	5
2	node2	111123105929	cpu_pc	5
2	node2	111123105934	cpu_pc	5
2	node2	111123105839	fc_mb	128

An invocation example

```
lsnodecanisterstats
```

The resulting output:

node_id	node_name	stat_name	stat_current	stat_peak	stat_peak_time
1	node1	cpu_pc	5	9	111123105330
1	node1	fc_mb	218	238	111123105440

An invocation example of a node-based, filtered invocation example for lsnodecanisterstats

```
lsnodecanisterstats -filtervalue stat_name=sas_io:stat_name=sas_mb node1
```

The resulting output:

node_id	node_name	stat_name	stat_current	stat_peak	stat_peak_time
1	node1	sas_mb	212	421	111123105840
1	node1	sas_io	2477	4184	111123105840

An invocation example of a historical view that can list multiple statistics and requires a node-based invocation

```
lsnodecanisterstats -history cpu_pc:fc_mb:sas_mb node1
```

The resulting output:

node_id	node_name	sample_time	stat_name	stat_value
2	node2	111123105839	cpu_pc	6
2	node2	111123105844	cpu_pc	5

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsnodevdpd (SVC) / lsnodecanistervdpd (Storwize family products)

Use the **lsnodevdpd** / **lsnodecanistervdpd** command to display the vital product data (VPD) for each node.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. Using the **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

object_id / object_name

(Required) Specifies the object name or ID.

Description

This command displays the VPD for the specified node or node canister. Each field is reported on a new line. All fields are strings. The VPD is split into sections. Each section has a section heading. The number of fields in that section follows each heading. Each section is separated by an empty line.

For example:

```
section name:3 fields
field1:value
field2:value
field3:value
```

```
new section:x fields
...
```

Some sections contain information about multiple objects of that type. Each object within the section is separated by an empty line.

For example:

```
section name:4 fields
object1 field1:value
object1 field2:value

object2 field1:value
object2 field2:value

new section: x fields
...
```

Note: For SAN Volume Controller 2145-8G4 nodes, the VPD displays the device serial number of the Fibre Channel adapter as N/A.

Table 49. Attribute values for lsnodevpd and lsnodecanistervpd	
Value	Description
system board	Displays the system board information.
part_number	Displays the total number of system part numbers.
system_serial_number	Displays the total number of system serial numbers.
number_of_processors	Displays the total number of system processors.
number_of_memory_modules	Displays the total number of memory modules.
number_of_fans	Displays the total number of system fans.

Table 49. Attribute values for lsnodevpd and lsnodecanistervpd (continued)	
Value	Description
number_of_FC_cards	Displays the total number of Fibre Channel (FC) cards.
number_of_Ethernet_cards	Displays the total number of Ethernet cards.
iscsi_initiator_name	Displays the iSCSI IQN that is stored in node vital product data (VPD).

An invocation example for SAN Volume Controller

```
lsnodevpd 1
```

The resulting output:

```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chscsiportauth

Use the **chscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

Syntax

➔ **lsportusb** -nohdr -delim delimiter usb_port_id ➔

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

usb_port_id

(Optional) Specifies the USB port ID. Used when detailed information about a USB port is required.

Description

This command displays information about Universal Serial Bus (USB) ports.

This table provides the attribute values that can be displayed as output view data.

Table 50. <i>lsportusb</i> output	
Attribute	Possible Values
id	Indicates the unique ID of the USB port in the system. This ID is the <code>usb_port_id</code> . The value is a numeric 0 or greater.
node_id	Indicates the ID of the node where the USB port is. The value is a numeric string.
node_name	Indicates the name of the node where the USB port is. The value is an alphanumeric string.
node_side	Indicates the side of the node where the USB port is. The values are <code>front</code> and <code>rear</code> .
port_id	Indicates the ID of the USB port on the node side. The value is a numeric 1 or greater.
status	Indicates the status of the USB port. The values are: <ul style="list-style-type: none">• <code>active</code>, which indicates that a USB flash drive is plugged in and can be used by the system.• <code>inactive</code>, which indicates that no USB flash drive is detected.• <code>unsupported</code>, which indicates that a USB device is plugged in but cannot be used.• <code>disabled</code>, which indicates that USB ports are disabled on this node.

Table 50. **lsportusb** output (continued)

Attribute	Possible Values
encryption_state	<p>Indicates the encryption status of the USB device that is attached to the port. The values are:</p> <ul style="list-style-type: none"> • Blank indicates that it is not in use for encryption • <code>validated</code> indicates that encryption keys are present and validated • <code>missing</code> indicates that encryption keys were validated and were then removed, and the DMP must run to confirm the absence. • <code>prepared</code> indicates that encryption keys are prepared as part of a rekey operation. • <code>validated_prepared</code> indicates that encryption keys are validated and prepared as part of a rekey operation. • <code>wrong_system</code> indicates that encryption keys are detected on the USB device but none valid for the system. • <code>old</code> indicates that the USB device contains encryption keys that were generated for this system - but they are not the current keys. • <code>error</code> indicates that an encryption key is detected and something might be wrong with it.
encryption_filename	<p>Indicates the name of the file in the <code>rot</code> directory of the USB device to which the encryption state relates. The file name can contain up to 110 characters.</p>
service_state	<p>Indicates the USB command status. The values are:</p> <ul style="list-style-type: none"> • Blank indicates that no command is active. • <code>running</code> indicates that <code>satask.txt</code> is processing, and default USB processing is ongoing. • <code>complete</code> indicates that <code>satask.txt</code> is processing and default USB processing is complete. • <code>install_image</code> indicates that <code>satask.txt</code> processing cannot start because there is an installation image on the USB flash drive.

A concise invocation example

```
lsportusb
```

The resulting output:

```
id:node_id:node_name:node_side:port_id:status:service_state
0:1:node1:rear:1:inactive
1:1:node1:rear:2:active:validated:complete
2:2:node2:rear:1:active::complete
3:2:node2:rear:2:active:wrong_system:complete
```

A detailed invocation example

```
lsportusb 3
```

The resulting output:

```
id 3

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrpghost

Use the **lsiogrpghost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezone

Use the **lstimezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

Syntax

Parameters

-filtervalue attribute=value

(Optional) Specifies a list of one or more filters. Only objects with a value that matches the filter attribute value are returned. If a capacity is specified, the units must also be included.

Note: Some filters allow the use of a wildcard when you enter the command. The following rules apply to the use of wildcards with the SAN Volume Controller CLI:

- The wildcard character is an asterisk (*).
- The command can contain a maximum of one wildcard, which must be the first or last character in the string.
- When you use a wildcard, enclose the filter entry within double quotation marks (" "), as follows:

```
lsportip -filtervalue "node_name=md*"
```

-filtervalue?

(Optional) Displays the valid filter attributes. The following filter attributes for the **lsportip** command are valid:

- id
- node_id
- node_name
- state
- failover

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

ethernet_port_id

(Optional) Specifies the ID of an Ethernet port (1, 2, 3, or 4). If omitted, a concise view is displayed for all ports. When you use this parameter, the detailed view of the specified port is returned and any value that is specified by the **-filtervalue** parameter is ignored. If you do not use the **ethernet_port_id** parameter, the concise view displays all ports that match the filtering requirements that are specified by the **-filtervalue** parameter.

Description

This command lists the configuration of the Ethernet ports for each node in the IBM Spectrum Virtualize system.

Use the **lsportip** command with the optional **ethernet_port_id** parameter to display a detailed view of the specified port.

Output rows for a port show the MAC address of that port if it can be determined. If the node and the Ethernet link are online, the rows also show the speed and duplex state of the link. The duplex field can have values of Half or Full, or it is blank if the node is offline.

The fourth row for each port shows any IP address that is configured for that port and are not failed over to a different node. The failover field on this row is set to no. The second row for each port shows any iSCSI addresses that are configured for the partner node, or for the local node with failover, and that are active on the port. The failover field on this row is set to yes.

The state field is set to unconfigured if there are no iSCSI addresses that are configured on the port. The state field is set to offline if there are configured addresses but the link is down, and online if the link is up. Any offline rows indicate a potential problem.

This command displays information about system port status.

This table provides the attribute values that can be displayed as output view data.

Table 51. lsportip output	
Attribute	Description
id	Indicates the ID of the Ethernet port.
node_id	Indicates the ID of the node that contains the port.
node_name	Indicates the name of the node that contains the port.
IP address	Indicates the IPv4 address (and is blank if there is none).
mask	Indicates the IPv4 subnet mask (and is blank if there is none).
gateway	Indicates the IPv4 gateway (and is blank if there is none).
IP_address_6	Indicates the IPv6 address (and is blank if there is none).

Table 51. **lsportip** output (continued)

Attribute	Description
prefix_6	Indicates the IPv6 prefix (and is blank if there is none).
gateway_6	Indicates the IPv6 gateway address (and is blank if there is none).
MAC	Indicates the current MAC address (blank if unknown).
duplex	Indicates the current duplex state of the port (blank if unknown).
state	Indicates the state of iSCSI addresses. The values can be: <ul style="list-style-type: none"> • unconfigured: There is no iSCSI address (or hardware might not exist). • configured: The iSCSI address is configured. • management_only: It is not configurable for I/O operations.
link_state	Indicates the link state of Ethernet port. The values are active and inactive.
host	Displays the IPv4 address that is used for host attachment.
remote_copy	Displays the IPv4 remote copy port group ID. Remote copy includes Metro Mirror, Global Mirror, and HyperSwap.
host_6	Displays the IPv6 address that is used for host attachment.
remote_copy_6	Displays the IPv6 remote copy port group ID. Remote copy includes Metro Mirror, Global Mirror, and HyperSwap.
remote_copy_status	Displays the IPv4 remote copy status. Remote copy includes Metro Mirror, Global Mirror, and HyperSwap.
remote_copy_status_6	Displays the IPv6 remote copy status. Remote copy includes Metro Mirror, Global Mirror, and HyperSwap.
vlan	Displays the virtual local area network (VLAN) ID associated with the IPv4 address on this port (a numeric character in the range 1 - 4094).
vlan_6	Displays the VLAN ID associated with the IPv6 address on this port (a numeric character from 1- 4094).
adapter_location	Displays the location of the adaptor that contains the Ethernet port (any number in the range 0 - 8). Where 1 - 8 is the PCIe expansion slot number and 0 means that the adaptor is part of the system board or not in a PCIe expansion slot.
adapter_port_id	Displays the location of the Ethernet port that is in the adapter (any number in the range 1 - 4).

Table 51. **lsportip** output (continued)

Attribute	Description
dcbx_state	<p>Displays the Data Center Bridging Capability Exchange protocol (DCBx) state of the port. A value of:</p> <ul style="list-style-type: none"> • unsupported indicates that the port does not accept priority flow control (PFC) configuration from the switch port, even if the switch is DCBx-capable. All ports that are less than 10 Gbps have this value. • enabled indicates that the connected switch port is enabled for DCBx and the port state is online. • disabled indicates that the connected switch port turned off for DCBx or the port state is offline. <p>On Ethernet ports that are 10 Gbps, DCBx is automatically enabled if the connected switch port has it enabled.</p> <p>Remember: When this field is disabled or unsupported, all PFC related fields are blank.</p>
fcoe_priority_tag	<p>Displays the numeric priority tag value for the Fiber Channel over Ethernet (FCoE) protocol that is assigned on the connected switch port. This value must be a number from 0 to 7 or blank.</p>
pfc_enabled_tags	<p>Displays a list of priority tags for which PFC is enabled on the connected switch port. If you want to use the lossless iSCSI or FCoE function, PFC must be enabled for the corresponding tags on the switch. Once enabled on the switch, the tags are displayed in this field. This value is either blank or is a colon-separated list of numbers from 0 to 7.</p> <p>Important: If no priority tags are defined on the switch, this field is blank. If priority tags are defined on the switch but PFC is not enabled for those priority tags, this field is blank.</p>
priority_group_0	<p>Displays the set of priority tags that are within the priority group zero. This value is either blank or is a colon-separated list of numbers from 0 to 7. This field is part of the Enhanced Transmission Selection (ETS) settings.</p>
priority_group_1	<p>Displays the set of priority tags that are within the priority group one. This value is either blank or is a colon-separated list of numbers from 0 to 7. This field is part of the ETS settings.</p>
priority_group_2	<p>Displays the set of priority tags that are within the priority group two. This value is either blank or is a colon-separated list of numbers from 0 to 7. This field is part of the ETS settings.</p>
priority_group_3	<p>Displays the set of priority tags that are within the priority group three. This value is either blank or is a colon-separated list of numbers from 0 to 7. This field is part of the ETS settings.</p>
priority_group_4	<p>Displays the set of priority tags that are within the priority group four. This value is either blank or is a colon-separated list of numbers from 0 to 7. This field is part of the ETS settings.</p>
priority_group_5	<p>Displays the set of priority tags that are within the priority group five. This value is either blank or is a colon-separated list of numbers from 0 to 7. This field is part of the ETS settings.</p>
priority_group_6	<p>Displays the set of priority tags that are within the priority group six. This value is either blank or is a colon-separated list of numbers from 0 to 7. This field is part of the ETS settings.</p>

Table 51. **lsportip** output (continued)

Attribute	Description
priority_group_7	Displays the set of priority tags that are within the priority group seven. This value is either blank or is a colon-separated list of numbers from 0 to 7. This field is part of the ETS settings.
bandwidth_allocation	<p>Displays a list of guaranteed bandwidth allocation percentages for priority groups zero through seven. The value is either blank or a colon-separated numeric list of bandwidth allocation percentages for each priority group, where each percentage is a whole number integer. This field is part of the ETS settings.</p> <p>Note: The field is blank if no specific bandwidths are allocated to any priority group on the network.</p>
storage	Indicates whether the IPv4 address is used for iSCSI backend storage attachment functions. The values are yes and no (default). If no address is specified, the value is blank.
storage_6	Indicates whether the IPv6 address on the port is used for iSCSI backend storage attachment functions. The values are yes and no (default). If no address is specified, the value is blank.
host_port_grp_id	<p>Indicates the host port group ID in both concise and detailed views. Values are 0 and 1-32.</p> <p>The default value is 0 for any Ethernet port.</p> <p>All configured host attachment ports have a non-zero host_port_grp_id.</p> <ul style="list-style-type: none"> 0 (default): For a new installation, all configured iSCSI ports that have the host flag set to no have this field set to 0. <p>Upon an update from older versions, all previously configured iSCSI ports are added to the default host port group that is 0. After the update to the current version, even though the host flag is set to yes, iSCSI ports are placed in host port group 0.</p> <ul style="list-style-type: none"> 1-32: These host port group IDs are assigned to each configured iSCSI port that has its host flag set to yes. <p>Host port grouping groups the ports that have the same speed with same rdma_type capability. Ports with same speed but with different rdma_type capabilities are grouped separately. Example: 25 Gbps speed ports with rdma_type as iWARP are grouped separately from 25 Gbps speed ports with rdma_type as RoCE.</p> <p>Host port grouping ensures that no more than four ports are discovered by a host during a discovery. A maximum of four ports per system node can belong to the same host port group ID. All ports that belong to the same host port group ID are the same speed and same rdma_type capability. Across two nodes of an I/O group, up to eight iSCSI ports (four per node) can belong to the same host port group ID.</p>
rdma_type	<p>A semicolon separated list that displays the RDMA protocol capabilities of the port. This field is blank for non-RDMA capable Ethernet ports. The values are:</p> <ul style="list-style-type: none"> RoCE - the port supports RDMA over Converged Ethernet protocol. iWARP - the port supports Internet Wide-area RDMA Protocol.

Table 51. **lsportip** output (continued)

Attribute	Description
lossless_host_attach	<p>This field displays whether priority flow control (PFC) is enabled for host attachment traffic on IPv4. If PFC is not enabled, then it shows the reason why. The values are:</p> <ul style="list-style-type: none"> • Blank - IP is not configured. • off-host_flag_disabled - host flag is not set. • off-vlan_not_configured - vlan is not configured. • off-priority_tag_not_enabled_on_switch - priority tag (hostattachcos set by using the chssystemethernet) is not enabled on the switch. • on - PFC is enabled
lossless_host_attach6	<p>This field displays whether priority flow control (PFC) is enabled for host attachment traffic on IPv6. If PFC is not enabled, then it shows the reason why. The values are:</p> <ul style="list-style-type: none"> • Blank - IP is not configured. • off-host_flag_disabled - host6 flag is not set. • off-vlan_not_configured - vlan is not configured. • off-priority_tag_not_enabled_on_switch - priority tag (hostattachcos set by using the chssystemethernet) is not enabled on the switch. • on - PFC is enabled
lossless_system	<p>This field displays whether priority flow control (PFC) is enabled for system traffic. If PFC is not enabled, then it shows the reason why. The values are:</p> <ul style="list-style-type: none"> • Blank - IP is not configured. • off-vlan_not_configured - vlan is not configured. • off-priority_tag_not_enabled_on_switch - priority tag (systemcos set by using the chssystemethernet) is not enabled on the switch. • on - PFC is enabled
lossless_storage	<p>This field displays whether priority flow control (PFC) is enabled for storage traffic on IPv4. If PFC is not enabled, then it shows the reason why. The values are:</p> <ul style="list-style-type: none"> • Blank - IP is not configured. • off-host_flag_disabled - storage flag is not set. • off-vlan_not_configured - vlan is not configured. • off-priority_tag_not_enabled_on_switch - priority tag (storagecos set by using the chssystemethernet) is not enabled on the switch. • on - PFC is enabled

Table 51. **lsportip** output (continued)

Attribute	Description
lossless_storage6	<p>This field displays whether priority flow control (PFC) is enabled for storage traffic on IPv6. If PFC is not enabled, then it shows the reason why. The values are:</p> <ul style="list-style-type: none"> Blank - IP is not configured. off-host_flag_disabled - storage6 flag is not set. off-vlan_not_configured - vlan is not configured. off-priority_tag_not_enabled_on_switch - priority tag (storagecos set by using the chssystemethernet) is not enabled on the switch. on - PFC is enabled
is_rdma_clustering	This field displays whether this Ethernet port is configured to use RDMA system node-to-node connections or not. The value is either yes, no, or blank.

In the following examples, which list different port configuration options, there are two lines for each possible Ethernet port, which represent the port and iSCSI behavioral effects. Port indices are assigned statically, and higher indices are used for optional ports.

A concise invocation example

```
lsportip
```

The resulting output:

```

id node_id node_name IP_address mask gateway IP_address_6 prefix_6 gateway_6

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode** / **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **ls timezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **set timezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmporttip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

Syntax

Parameters

-filtervalue attribute=value

(Optional) Specifies a list of one or more filters. Only objects with a value that matches the filter attribute value are returned. If a capacity is specified, the units must also be included.

-filtervalue?

(Optional) Displays the valid filter attributes. The following filter attributes for the **lsportfc** command are valid:

- type

- status
- node_id
- fc_io_port_id
- attachment

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

object_id

(Optional) Specifies the ID of an object that is displayed in the view.

Description

This command enables you to view information about clustered system port status.

This table provides the attribute values that can be displayed as output view data.

The following table shows the possible outputs:

<i>Table 52. lsportfc output</i>	
Attribute	Description
id	Indicates a unique value for the object. The value must be a numeric 0 or greater.
fc_io_port_id	Indicates the FC I/O port ID. The value must be a positive integer.
port_id	Indicates the platform port ID. The value must be a positive integer.
type	Indicates the type of platform port. The value can be either <code>fc</code> or <code>ethernet</code> .
port_speed	Indicates the I/O port speed. The value is XGb. The value is N/A if the port has never been active. If the port is inactive, it shows the last-known port speed.
node_id	Indicates the ID of the node containing the port. The value must be a positive integer.
node_name	Indicates the name of the node containing the port.
WWPN	Indicates the I/O port worldwide port name (WWPN). The value must be in 16-character hexadecimal format.
nportid	Indicates the most recent NPort ID used by the port. The value must be in 6-character hexadecimal format, and all zeroes if never active.

Table 52. **lsportfc** output (continued)

Attribute	Description
status	Indicates whether the port is configured to a device of Fibre Channel (FC) port. The values are: <ul style="list-style-type: none"> • active • inactive_configured • inactive_unconfigured.
switch_WWPN	Indicates the WWPN of the device that was most recently attached to the port. The value must be in 16-character hexadecimal format, or all zeroes if the port has never been active.
fpma	Indicates the Fabric Provided MAC Address (FPMA) assigned to the Fiber Channel over Ethernet (FCoE) VN_PORT port. The value is a formatted 48-bit MAC address. If the switch is connected to an FCF, the value is N/A for ports that are never active. If the port is inactive the last-known FPMA is used.
vlan_id	Indicates the VLAN ID on which a specific VN port is communicating. The value is up to a 4-character decimal string. The value is N/A for ports that are never active. If the port is inactive, the last-known VLAN ID is used.
fcf_MAC	Indicates the MAC address for the switch attached to the VN port. The value is N/A for ports that are never active. The value is a formatted 48-bit MAC address. If the port is inactive, the last known fcf_MAC value is used.
attachment	Indicates if the port is attached to an FC switch or directly to an FC host. (Or, if the port is offline, it specifies which one it was attached to when last online.)
cluster_use	Indicates the node's current capability for local or partner cluster communications: <ul style="list-style-type: none"> • none indicates the port cannot be used for any node communication • local indicates the port can be used for local system node communication • partner indicates the port can be used for partner system node communication • local_partner indicates the port can be used for both local and partner system node communication
adapter_location	Indicates the location of the adapter containing the Ethernet port (any number from 0 to 6).
adapter_port_id	Indicates the location of the Ethernet port that is in the adapter (any number from 1 to 4).
fabric_WWN	Indicates the World Wide Name (WWN) value for the connected fabric string. The value must be in 16-character hexadecimal format, or all zeroes if the port has never been active or the port is not connected to a fabric.

A concise invocation example

```
lsportfc
```

The resulting output:

id	fc_io_port_id	port_id	type	port_speed	node_id	node_name	WWPN	nportid	status	attachment	cluster_use
0	1	1	fc	8Gb	1	node1	500507680140BADD	0E2411	active	switch	local_partner

A detailed invocation example

```
lsportfc 10
```

The detailed resulting output:

```
id 10
fc_io_port_id 5
port_id 3
type ethernet
port_speed 10Gb
node_id 6
node_name node3
WWPN 50050768015051E5
nportid 012701
status active
switch_WWPN 202700053346FA3D
fpma 0E:FC:00:01:27:01
vlanid 100
fcf_MAC 00:05:73:C2:CA:B4
attachment switch
cluster_use none
adapter_location 1
adapter_port_id 1
fabric_WWN 202700053346FA3C
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

[rmnode \(SVC\) / rmnodecanister \(Storwize family products\)](#)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

[rmportip](#)

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

[rmthrottle](#)

Use the **rmthrottle** command to remove the throttle object associated with any volume.

[setclustertime \(Discontinued\)](#)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

[setsystemtime](#)

Use the **setsystemtime** command to set the time for the system.

[setpwdreset](#)

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

[settimezone](#)

Use the **settimezone** command to set the time zone for the system.

[showtimezone](#)

Use the **showtimezone** command to display the current time zone settings for the cluster.

[startstats](#)

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

[stopstats \(Deprecated\)](#)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

[stopcluster \(Discontinued\)](#)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

[stopsystem](#)

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

[swapnode](#)

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

Syntax

Parameters

-filtervalue attribute=value

(Optional) Specifies a list of one or more filters. Only objects with a value that matches the filter attribute value are returned. If a capacity is specified, the units must also be included.

-filtervalue?

(Optional) Displays the valid filter attributes. The following filter attributes for the **lsportsas** command are valid:

- node_id
- status
- attachment
- type

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed view. This parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum allowable width for each data item. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

Description

This command displays information about system port status.

This command output shows all available paths, which are defined by zoning, independent of their usage. This means that the command output includes paths that are not used because of port masking.

This table provides the attribute values that can be displayed as output view data.

Table 53. lsportsas output	
Attribute	Description
id	Indicates the line number within the displayed information (numeric string).
port_id	Indicates the ID of the port.
port_speed	Indicates the speed of the I/O port (in XGb). This speed is the fastest local link speed for the SAS port. The value is the last-known port speed if the port is inactive, and N/A if port has is unused and was never active.
node_id	Indicates the ID of the node that contains the port (numeric string).
node_name	Indicates the name of the node that contains the port (alphanumeric string).
WWPN	Indicates the worldwide port name (WWPN) for the I/O port (16-character hexadecimal string).

Table 53. **lsportsas** output (continued)

Attribute	Description
status	Indicates the status of the port (numeric string). The values can be: <ul style="list-style-type: none"> • online if the port is functioning • offline if the port is not functioning • offline_unconfigured if not functioning but not configured by the user • degraded if one or more ports are not functioning or have a lower speed than others • excluded if excluded by the user or system
switch_WWPN	Indicates the WWPN of the switch port if attached to switch (16-character hexadecimal string), or is blank. If the port is offline, the last-known value is displayed.
attachment	Indicates what the port is attached to. The possible values are: <ul style="list-style-type: none"> • drive • controller • switch • host • enclosure • none If the port is offline, the field shows what was attached when the port was last online.
type	Indicates how the port is configured. This field also shows the devices that can be attached to the SAS port. The possible values are: <ul style="list-style-type: none"> • drive • enclosure • enclosure_controller • host_controller • none
adapter_location	Displays the location of the adapter that contains the SAS port (any number in the range 0 - 6).
adapter_port_id	Displays the location of the SAS port that is in the adapter (any number in the range 1 - 4).

An invocation example

```
lsportsas
```

The resulting output:

id	port_id	port_speed	node_id	node_name	WWPN	status	switch_WWPN	attachment	type	adapter_location
0	1	3Gb	1	node1	500507680140004A	offline		enclosure	enclosure	0
1	2	6Gb	1	node1	500507680150004A	online	5001234567892000	switch	host_controller	0
4	1	3Gb	2	node2	50050768014051E5	online		host	host_controller	0
5	2	3Gb	2	node2	50050768015051E5	offline_unconfigured		none	none	0

An invocation example

```
lsportsas
```

The resulting output:

id	port_id	port_speed	node_id	node_name	WWPN	status	switch_WWPN	attachment	type	adapter_location
adapter_port_id										
0	1	12Gb	1	node1	50050768056C009E	online	500507680600B63F	enclosure	enclosure	0
1	2	12Gb	1	node1	50050768056C009F	online	500507680600B64F	enclosure	enclosure	1
2	0	12Gb	1	node1	50050768056C009G	online	500507680600B65F	enclosure	internal	0
4	1	12Gb	2	node2	50050768056C009I	online	500507680600B66F	enclosure	enclosure	3
5	2	12Gb	2	node2	50050768056C009J	online	500507680600B67F	enclosure	enclosure	4
6	0	12Gb	2	node2	50050768056C009K	online	500507680600B68F	enclosure	internal	1

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

[chnodebootdrive](#)

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

[chnodehw \(SVC\) / chnodecanisterhw \(Storwize family products\)](#)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

[chquorum](#)

Use the **chquorum** command to change the quorum association.

[chsecurity](#)

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

[chsite](#)

Use the **chsite** command to change the site name.

[chsra](#)

Use the **chsra** command to configure support assistance.

[chsystem](#)

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

[chsystemcert](#)

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

[chsystemip](#)

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

[chsystemethernet](#)

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

[chthrottle](#)

Use the **chthrottle** command to change attributes associated with a specified throttle object.

[cleardumps](#)

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

[cpdumps](#)

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

[detectiscsistorageportcandidate](#)

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

[dumpconfig](#) (Discontinued)

Attention: The **dumpconfig** command is discontinued.

[help](#)

Use the **help** (or **man**) command to display help information for system commands.

[lsclustercandidate](#) (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

[lscluster](#) (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

[lsclusterip](#) (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

[lsclusterstats](#) (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/ **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

Syntax

➔ **lsquorum** -nohdr -delim *delimiter* quorum_index ➔

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim *delimiter*

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **delim** parameter overrides this behavior. Valid input for the **delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified character.

quorum_index

(Optional) Specifies the quorum device by its index number. When you use this parameter, a detailed view of the specified device is returned. If you do not specify a device, then a concise view of all quorum devices is displayed.

Description

This command displays a concise list or a detailed view of the MDisks or drives that the system is using to store quorum data. This information can be used to ensure that the quorum candidates are on separate storage subsystems.

Note: The object type is either MDisk or drive, but only MDisks are used to hold quorum data. If the quorum object type is a drive, the controller ID and name fields are blank.

This table provides the attribute values that can be displayed as output view data.

Table 54. lsquorum output

Attribute	Possible Values
quorum_index	Indicates the quorum device by index number.
status	Indicates the quorum device status.
name	Indicates the name of the object that is used as the quorum device.
controller_id	Indicates the ID of the controller of an MDisk object that is used as the quorum device.
controller_name	Indicates the name of the controller of an MDisk object that is used as the quorum device.
active	Indicates whether this quorum is the active quorum device the system uses as a tie breaker.
object_type	Indicates the type of object the quorum device uses.
override	Indicates whether the automatic quorum selection for this quorum device was overridden.
site_id	Indicates the site value for the quorum device. This numeric value is 1, 2, 3, or blank.
site_name	Indicates the site name for the quorum device (MDisks or drives). This is an alphanumeric value or is blank. For the quorum application, this name identifies the site it is deployed at. By default, this name is the local host's IP address, but a custom alias can also be set.

A concise invocation example

```
lsquorum
```

The concise resulting output:

```
quorum_index status id name controller_id controller_name active object_type
override site_id site_name
0 online 1 mdisk1 1 controller1 no mdisk
no 2 site2
1 online 2 mdisk2 1 controller1 no mdisk
no 1 site1
2 online yes device
no quorumhost/9.155.24.98
```

A detailed invocation example

```
lsquorum 1
```

The detailed resulting output:

```
quorum_index 1
status online
id 309
name mdisk9
controller_id 1
controller_name controller3
active yes
```

```
object_type drive
override yes
site_id 1
site_name CPD1
```

```
quorum_index 2
status online
id 33
name
controller_id
controller_name
active no
object_type drive
override no
site_id 1
site_name CPD1
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsroute

Use the **lsroute** command to display the IP routing table.

lsptimezones

Use the **lsptimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsroute

Use the **lsroute** command to display the IP routing table.

Syntax

➔ **lsroute** -delim *delimiter* -nohdr ➔

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim *delimiter*

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

Description

This command displays the IP routing table. The table provides details of the gateway that is used for IP traffic to a range of IP addresses for each Ethernet port. This information can be used to diagnose configuration node accessibility problems. The **lsroute** command is equivalent to the Linux **route** command.

An invocation example

```
lsroute
```

The resulting output:

```
Kernel IP routing table
Destination      Gateway         Genmask         Flags Metric Ref    Use Iface
9.71.46.0        0.0.0.0        255.255.254.0   U        0      0      0 eth0
127.0.0.0        0.0.0.0        255.0.0.0       U        0      0      0 lo
0.0.0.0          9.71.46.1      0.0.0.0         UG       0      0      0 eth0
```

```
Kernel IPv6 routing table
Destination      Next Hop        Flags Metric Ref    Use Iface
2002:914:fc12:849::/64 ::              UA    256   3675   0 eth0
fe80::/64        ::              U     256   0      0 eth0
::/0             fe80::7:b4ff:fe00:500 UGDA 1024  1      0 eth0

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

Syntax

➔ **lstimezones** 

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If no data is displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by a colon character.

Description

This command displays a list of all the time zones that are available on the system. Each time zone is assigned an ID. This ID can be used in the **settimezone** command.

An invocation example

```
lstimezones
```

The resulting output

```
id timezone
0 Africa/Abidjan
1 Africa/Accra
2 Africa/Addis_Ababa
3 Africa/Algiers
4 Africa/Asmera
5 Africa/Bamako
6 Africa/Bangui
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

[chnodebootdrive](#)

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

[chnodehw \(SVC\) / chnodecanisterhw \(Storwize family products\)](#)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/ **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

Syntax

► **lssasportcandidate** 

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

Description

This command returns a list of unconfigured, logged in SAS ports.

Note: The **lssasportcandidate** command presents a list of host SAS ports that are logged in to nodes. However, there are situations when the list might include host SAS ports that are no longer logged in or even part of the SAN fabric. For example, if a host SAS port is unplugged from a switch but **lssasportcandidate** shows the WWPN that is logged in to all nodes, the incorrect entry is removed when another device is plugged in to the same switch port that previously contained the removed host SAS port.

This table shows the possible output:

Table 55. lssasportcandidate output	
Attribute	Description
sas_WWPN	Indicates that the SAS WWPN that is logged in is unconfigured (not assigned to a host). This value must be 16 hexadecimal characters.

An invocation example

```
lssasportcandidate
```

The resulting output:

```
sas_WWPN
200600A0B813B7AC
200600A0B813B7AD
```

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrpghost

Use the **lsiogrpghost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

Syntax

► **lssecurity** -nohdr -delim *delimiter* ►

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If no data exists to be displayed, headings are not displayed.

-delim *delimiter*

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

Description

This command displays the current system SSL, SSH, or TLS security settings.

This table provides the possible values that are displayed for the **lssecurity** command.

Table 56. **lssecurity** attribute values

Attribute	Value
sslprotocol	<p>Identifies the current security level setting, a numeric value of 1, 2, 3, or 4. Use these sslprotocol security level settings.</p> <ul style="list-style-type: none"> • 1 Allows TLS 1.0, TLS 1.1, and TLS 1.2, but disallows SSL 3.0. • 2 Disallows TLS 1.0 and TLS 1.1. • 3 Also disallows TLS 1.2 cipher suites that are not exclusive to 1.2. • 4 Additionally disallows RSA key exchange ciphers. <p>Note: You cannot use the management GUI if the sslprotocol value is set to 1 and you are using SSL 3.0 or TLS 1.0.</p>
sshprotocol	<p>Identifies the current security level for SSH, a numeric value of 1 or 2. Use these sshprotocol security level settings.</p> <ul style="list-style-type: none"> • 1 Allows the following key exchange methods. <ul style="list-style-type: none"> – curve25519-sha256 – curve25519-sha256@libssh.org – ecdh-sha2-nistp256 – ecdh-sha2-nistp384 – ecdh-sha2-nistp521 – diffie-hellman-group-exchange-sha256 – diffie-hellman-group16-sha512 – diffie-hellman-group18-sha512 – diffie-hellman-group14-sha256 – diffie-hellman-group14-sha1 – diffie-hellman-group1-sha1 – diffie-hellman-group-exchange-sha1 • 2 Allows the following key exchange methods. <ul style="list-style-type: none"> – curve25519-sha256 – curve25519-sha256@libssh.org – ecdh-sha2-nistp256 – ecdh-sha2-nistp384 – ecdh-sha2-nistp521 – diffie-hellman-group-exchange-sha256 – diffie-hellman-group16-sha512 – diffie-hellman-group18-sha512 – diffie-hellman-group14-sha256 – diffie-hellman-group14-sha1

An invocation example

```
lssecurity
```

The resulting output

```
sslprotocol 4
sshprotocol 1
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

[chnodebootdrive](#)

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

[chnodehw \(SVC\) / chnodecanisterhw \(Storwize family products\)](#)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

[chquorum](#)

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chusra

Use the **chusra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

ls_timezone

Use the **ls_timezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **set_timezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lssite

Use the **lssite** command to report the names of the sites.

Syntax

► lssite -nohdr -delim *delimiter* ►

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim *delimiter*

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

Description

This command reports the names of the sites.

Remember: This command is only applicable when a system is configured as a stretched system or a HyperSwap system (specify the **chsystem -topology** command).

In a stretched configuration these applications are spread across two or more geographic locations or sites:

- Nodes
- Storage
- Host servers
- Infrastructure

This table provides the attribute values that can be displayed as output view data.

Table 57. lssite attribute values	
Attribute	Value
id	Identifies the numeric value that represents the site. The value can be 1, 2, or 3.
name	Identifies the site name.

An invocation example

```
lssite
```

The resulting output:

```
id name
1  CPD1
2  CPD2
3  Quorum
```

Related reference

[addnode](#) (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsstorageport](#)

Use the **addiscsstorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster](#) (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsstorageport](#)

Use the **chiscsstorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands.

All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

Isclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If no data needs to be displayed, headings are not displayed.

-filtervalue?

(Optional) Displays a list of valid filter attributes for the **-filtervalueattribute=value** parameter. The valid filters for the **lssra** command are:

- port_id
- owning_node_id
- current_node_id
- host_io_permitted
- virtualized

-filtervalue attribute=value

(Optional) Specifies a list of one or more filters. Only objects with a value that matches the filter attribute value are returned. If a capacity is specified, the units must also be included.

Note: Some filters allow the use of a wildcard when you enter the command. The following rules apply to the use of wildcards when you are using the CLI:

- The wildcard character is an asterisk (*).
- The command can contain a maximum of one wildcard.
- When you are using a wildcard, you must enclose the filter entry within double quotation marks (" ").

-config_node

(Optional) Specifies the local field values for the current configuration node. Do not specify this parameter if the specified node is part of an active clustered system. This parameter is mutually exclusive with all other parameters.

Description

This command displays both secure remote assistance status and the time of the last login.

This table provides the attribute values that can be displayed as output view data.

<i>Table 58. lsra output</i>	
Attribute	Description
status	Indicates whether the support assistance is enabled or not enabled (default).
token_age_in_days	Displays the number of days that the current token exists.
active_monitor_user_count	Displays the number of support assistance monitor users that are logged in to this system.
monitor_user_last_login	Displays the time of the last monitor user login in the format YYMMDDHHMMSS. The default is blank.
active_privileged_user_count	Displays the number of secure remote access privileged users that are currently logged on.
privileged_user_last_login	Displays the date and time of the last support assistance privileged user login on the system in the format YYMMDDHHMMSS. The default is blank.
remote_support_test_status	Indicates the remote system support service state when it was last tested. The values are: <ul style="list-style-type: none"> • disconnected (default) • connecting • connected • active • failure This value is the maximum state that is reached on the configuration node, in increasing order from disconnected through to failure.
remote_support_test_time	Indicates the time stamp of the last remote system support test. The value must be in the format YYMMDDHHMMSS.
remote_support_config_changed_after_test	Indicates that a support center was added since the system was last tested. The values are yes or no (default).
remote_support_enabled	Indicates whether remote support is enabled. The values are yes or no (default).

Table 58. **lssra** output (continued)

Attribute	Description
remote_support_status	Indicates the remote support service status or state. If you do not enable remote support the status is disconnected. The values are: <ul style="list-style-type: none"> • disconnected (default) • connecting • connected • active • failure This value is the maximum state across all online nodes, in increasing order from disconnected through to failure.
remote_support_enabled_time	Indicates the time stamp for the last successful creation of a secure tunnel by a remote support service. The value must be in the format YYMMDDHHMMSS.
remote_support_idle_timeout	Indicates the idle timeout value. The value must be a number (non-negative), and the default value is 0.
remote_support_center_id	Indicates the support center ID (specified by using lssystemsupportcenter) that is used to establish the secure tunnel. The value must be a number 0 -11, and the default is blank.

An invocation example on a system with local support assistance enabled

```
lssra
```

The detailed resulting output:

```
status enabled
active_monitor_user_count 0
monitor_user_last_login
active_privileged_user_count 0
privileged_user_last_login
token_age_in_days 7
remote_support_test_status connected
remote_support_test_time 161123183137
remote_support_config_changed_after_test no
remote_support_enabled no
remote_support_status disconnected
remote_support_enabled_time
remote_support_idle_timeout 0
remote_support_center_id
```

An invocation example on a system with remote support assistance enabled

```
lssra
```

The detailed resulting output:

```
status enabled
active_monitor_user_count 0
monitor_user_last_login
active_privileged_user_count 1
privileged_user_last_login 161123204006
token_age_in_days 30
remote_support_test_status connected
remote_support_test_time 1611231530220
remote_support_config_changed_after_test no
remote_support_enabled yes
remote_support_status active
remote_support_enabled_time 161123183137
```

```
remote_support_idletimeout 0
remote_support_center_id 0
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

[chnodebootdrive](#)

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

[chnodehw \(SVC\) / chnodecanisterhw \(Storwize family products\)](#)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

[chquorum](#)

Use the **chquorum** command to change the quorum association.

[chsecurity](#)

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsscsiportauth

Use the **lsscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsscsistorageport

Use the **lsscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsscsistorageportcandidate

Use the **lsscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezone

Use the **lstimezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If no data is displayed, headings are not displayed.

-filtervalue?

Displays a list of valid filter attributes for the **-filtervalueattribute=value** parameter. The valid filters for the **lsthrottle** command are:

- throttle_type

-filtervalue attribute=value

(Optional) Specifies a list of one or more filters. Only objects with a value that matches the filter attribute value are returned. If a capacity is specified, the units must also be included.

Note: Some filters allow the use of a wildcard when you enter the command. The following rules apply to the use of wildcards when you are using the CLI:

- The wildcard character is an asterisk (*).
- The command can contain a maximum of one wildcard.
- When you are using a wildcard, you must enclose the filter entry within double quotation marks (" ").

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

Description

This command lists throttle objects that are configured in the clustered system.

Note: The throttle limits are per node.

This table provides the attribute values that can be displayed as output view data.

Table 59. <i>lsthrottle</i> output	
Attribute	Description
throttle_id	Indicates the unique ID for the throttle object. The value is a number 0 - 10144.
throttle_name	Indicates the unique name for the throttle object. The value is an alphanumeric string that is 63 characters long.
object_id	Indicates the ID of the object to which throttle is applied. The value is a number 0 - 8191.
object_name	Indicates the name of the object to which throttle is applied. The value is an alphanumeric string that is 63 characters long.
throttle_type	Indicates the type of throttle object. The values are: offload, vdisk, host, hostcluster, and mdiskgrp.
IOPs_limit	Indicates the limit of configured IOPs. The value is a numeric string in the range 0 - 33554432. If no limit is specified the value is blank.
bandwidth_limit_MB	Indicates the bandwidth (in MBps). The value is a numeric string in the range 0 - 268435456. If no limit is specified the value is blank.

An invocation example

```
lsthrottle
```

The detailed resulting output:

throttle_id	throttle_name	object_id	object_name	throttle_type	IOPs_limit	bandwidth_limit_MB
0	throttle0	1	R48U20_213	host		40
1	throttle1	0	WinHostClust	hostcluster	8000	
2	throttle2	9	vdisk0	vdisk		20
3	throttle3	11	mdiskgrp0	mdiskgrp		100
0	throttle4			offload		500

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lssystem

Use the **lssystem** command to display a detailed view of a system.

Syntax

➤ **lssystem** 

Parameters

-nohdr

(Optional) By default, headings are displayed for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If no data exists to be displayed, headings are not displayed.

-delim delimiter

(Optional) In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a character with 1 byte. In a detailed view, the data is separated from its header by the specified delimiter.

Description

This command displays a detailed view of a system.

This table provides the attribute values that can be displayed as output view data.

Table 60. <i>lsystem</i> output	
Attribute	Possible Values
layer	The value can be either: <ul style="list-style-type: none">• replication, which means the system can create partnerships.• storage (default), which means the system can present storage.
location	The location is local or remote.
statistics status	The status is on or off.
auth_service_type	Native Lightweight Directory Access Protocol (LDAP)
auth_service_configured	True if the auth_service_type is configured to be LDAP-only (if at least one LDAP server is configured).
auth_service_enabled	True if the auth_service_type is configured.
email_state	The possible values are: <ul style="list-style-type: none">• running• stopped• invalid

Table 60. **lsystem** output (continued)

Attribute	Possible Values
partnership	<p>The possible values are:</p> <ul style="list-style-type: none"> • fully_configured • partially_configured_local • partially_configured_local_stopped • not_present • fully_configured_stopped • fully_configured_remote_stopped • fully_configured_local_excluded • fully_configured_remote_excluded • fully_configured_exceeded • Blank
tier	<p>Indicates which system information is being reported. The values are:</p> <ul style="list-style-type: none"> • tier0_flash • tier1_flash • tier_enterprise • tier_nearline • tier_scm
tier_capacity	Indicates the total MDisk storage in the tier.
tier_free_capacity	Indicates the amount of MDisk storage in the tier that is unused.
compression_active	Indicates whether any compressed volume copies exist in non-data reduction pools. Compressed volumes that are in data reduction pools do not count towards this value.
compression_virtual_capacity	Indicates the total virtual (provisioned) capacity for all compressed volume copies in non-data reduction pools. Compressed volumes that are in data reduction pools do not count towards this value. This value is in unsigned decimal format.
compression_compressed_capacity	Indicates the total used capacity for all compressed volume copies in non-data reduction pools. Compressed volumes that are in data reduction pools do not count towards this value. This value is in unsigned decimal format.
compression_uncompressed_capacity	Indicates the total uncompressed used capacity for all compressed volume copies in non-data reduction pools. Compressed volumes that are in data reduction pools do not count towards this value. This value is in unsigned decimal format.

Table 60. **lssystem** output (continued)

Attribute	Possible Values
physical_capacity	Indicates the total physical capacity of all standard-provisioned and thin-provisioned storage that is managed by the storage system. The value is rounded to two decimal places.
physical_free_capacity	Indicates the total free physical capacity of all standard-provisioned and thin-provisioned storage that is managed by the storage system. The value is rounded to two decimal places.
total_reclaimable_capacity	Indicates the unused (free) capacity that will be available after data is reduced. For storage pools that are not data reduction pools, this field reports 0.00MB. Note: total_reclaimable_capacity is a sum of all the lsmdiskgrp reclaimable_capacities , which has a +/-1% margin. Therefore, this field has up to a +/-4% margin.
used_capacity_before_reduction	Indicates the total amount of data that is written to thin-provisioned and compressed volume copies that are in data reduction storage pools - before data reduction occurs. This value does not include standard-provisioned volumes (that can be created in a data reduction storage pool) because they are not eligible for reduction.
used_capacity_after_reduction	Indicates the total amount of capacity that is used for thin-provisioned and compressed volume copies in the storage pool after data reduction occurs.
overhead_capacity	Indicates the overhead capacity consumption in all storage pools that is not attributed to data.
rc_buffer_size	Indicates the resource buffer size that is assigned for Metro Mirror, Global Mirror, and HyperSwap Copy Services.
has_nas_key	The value is yes or no.
total_drive_raw_capacity	The total known capacity of all discovered drives (regardless of drive use).
email_organization	Indicates the user's organization that is shown in the call home email function.
email_machine_address	Indicates the user's mailing address that is shown in the call home email function.
email_machine_city	Indicates the user's city that is shown in the call home email function.
email_machine_state	Indicates the user's state that is shown in the call home email function.

Table 60. **lssystem** output (continued)

Attribute	Possible Values
email_machine_zip	Indicates the user's postal code that is shown in the call home email function.
email_machine_country	Indicates the user's country that is shown in the call home email function.
cache_prefetch	Indicates whether cache prefetching is enabled across the system. The values are on and off.
local_fc_port_mask	Indicates the Fibre Channel (FC) input/output (I/O) ports that a system can use for node-to-node communications on a local system if those FC I/O ports exist on a node. The value is 64 binary bits.
partner_fc_port_mask	Indicates the FC I/O ports that a system can use for system-to-system communications on a partner system if those FC I/O ports exist on a node. The value is 64 binary bits.
topology	Indicates the system topology: <ul style="list-style-type: none"> • standard • stretched • hyperswap
topology_status	Indicates the system topology status: <ul style="list-style-type: none"> • dual_site • recovered_site_1 • recovered_site_2
compression_destage_mode	Indicates the cache destage mode operation for Real-time compression within the cluster.
rc_auth_status	Indicates remote copy authentication. Remote copy includes Metro Mirror, Global Mirror, and HyperSwap. The values are: <ul style="list-style-type: none"> • chap • none (default)
vdisk_protection_time	Indicates the volume protection time in minutes (whether volume protection is enabled or not enabled). The value must be a number from 15 (default) to 1440.
vdisk_protection_enabled	Indicates whether volume protection is enabled (yes) or disabled (no) for a system.
product_name	Indicates the product name (an alphanumeric string of no more than 62 characters).
odx	Indicates whether offloaded data transfer (ODX) is enabled or disabled. The values are on and off.
easy_tier_acceleration	Indicates Easy Tier and pool balance acceleration status. The values are on and off.

Table 60. *lssystem* output (continued)

Attribute	Possible Values
max_replication_delay	Indicates the value for maximum replication delay and is a numeric value in the range 0 - 360.
partnership_exclusion_threshold	Indicates the partnership exclusion threshold value and is a numeric value in the range 30 - 315.
ibmcustomer	Indicates the customer number. The value is blank or is a number that contains 7 - 10 digits.
ibmcomponent	Indicates the component. The value is blank, SANVCNSW1, or SPVIRT4CL .
ibmcountry	Indicates the country. The value is blank or a 3-digit number.
tier_0_flash_compressed_data_used	Indicates the capacity of compressed data that is used on the flash tier 0 storage tier. The value must be a number with two decimal places.
tier_1_flash_compressed_data_used	Indicates the capacity of compressed data that is used on the flash tier 1 storage tier. The value must be a number with two decimal places.
tier_enterprise_compressed_data_used	Indicates the capacity of compressed data that is used on the tier 2 enterprise storage tier. The value must be a number with two decimal places.
tier_nearline_compressed_data_used	Indicates the capacity of compressed data that is used on the tier 3 nearline storage tier. The value must be a number with two decimal places.
enhanced_callhome	Indicates whether to collect enhanced data in the call home report. The values are on or off. The enhanced reports include operational and event-related data and specific configuration information that is included in the inventory report. This function alerts the support center about hardware failures and potentially serious configuration or environmental issues. The support center can use the configuration information to automatically generate best practices or recommendations that are based on your actual configuration.
censor_callhome	Indicates that sensitive data is stripped from enhanced call home data. The values are on or off.
total_mdisk_capacity	Indicates the sum of mdiskgrp capacity plus the capacity of all unmanaged MDiskS.
space_in_mdisk_grps	Indicates the sum of mdiskgrp capacity.
space_allocated_to_vdisks	Indicates the sum of mdiskgrp real_capacity.
total_free_space	Indicates the sum of mdiskgrp free_capacity.
total_vdiskcopy_capacity	Indicates the total provisioned capacity of all volume copies in the cluster.

Table 60. **lssystem** output (continued)

Attribute	Possible Values
total_used_capacity	Indicates the sum of mdiskgrp used_capacity.
total_vdisk_capacity	Indicates the total provisioned capacity of volumes in the cluster.
total_allocated_extent_capacity	Indicates the total size of all extents that are allocated to VDisks or otherwise in use by the system.
total_overallocation	Indicates the total_vdiskcopy_capacity as a percentage of total_mdisk_capacity. If total_mdisk_capacity is zero, then total_overallocation should display 100.
tier0_flash_compressed_data_used	Indicates the capacity of compressed data used on the flash tier 0 storage tier.
tier1_flash_compressed_data_used	Indicates the capacity of compressed data used on the flash tier 1 storage tier.
deduplication_capacity_saving	Indicates the total amount of used capacity that is saved by data deduplication. This saving is before any compression.
compression_opportunity	Indicates the total amount of capacity of all volume-copies within data reduction pools that are enabled for compression. It does not include Real-time compression capacity or capacity that has been saved by data deduplication.
deduplication_opportunity	Indicates the total amount of used_capacity_before_reduction of all volume-copies within data reduction pools that are enabled for data deduplication.
host_unmap	This field displays whether SCSI Unmap support is enabled from the Host perspective. The possible values that are displayed are on or off.
backend_unmap	This field displays whether SCSI Unmap support for backend storage is enabled by the administrator. The possible values that are displayed are on or off.
quorum_mode	This field displays the mode that quorum is in for tie-breaking. The possible values that are displayed are standard, preferred, or winner.
quorum_site_id	This field displays the site ID that quorum uses when the quorum mode is set to preferred or winner . The possible values that are displayed are 1 or 2.
quorum_site_name	This field displays the site name that quorum uses when the quorum mode is set to preferred or winner .
quorum_lease	This field displays the lease duration that should be used. The possible values that are displayed are short or long.

Information about the remote system is reported by the **lssystem** command if you issue either the **mkfcpartnership** or **mkippartnership** command from the local system to the remote system. For example, if the partnership is at least partially established from the local system.

Issue the **lssystem** command to display a detailed view of the system.

Detailed view shows the fields that are described for remote systems only; if the system **location** is **local**, then **partnership** and **bandwidth** do not apply (and are not defined or provided). For a remote system, these fields indicate the following information:

location

remote or **local**

partnership

fully_configured

The **mkfcpartnership** or **mkippartnership** command is issued in both directions and the remote system is online and available.

partially_configured_local

The **mkfcpartnership** or **mkippartnership** command is issued from the local system to the remote system. The remote system is online and available for partnership.

partially_configured_local_stopped

The **mkfcpartnership** or **mkippartnership** command is issued from the local system to the remote system. The **chpartnership** command with the **stop** parameter is issued from the local system, and the remote system is online and available. Issue the **chpartnership** command with the **start** parameter on the local system, and **mkfcpartnership** or **mkippartnership** on the remote system.

not_present

The **mkfcpartnership** or **mkippartnership** command is issued from the local system to the remote system, and the remote system is not available. Either the remote system is offline, or it is not connected to the local system.

fully_configured_stopped

The **mkfcpartnership** or **mkippartnership** command is issued in both directions and the remote system is online and available. The **chpartnership** command with the **stop** parameter is issued from the local system.

fully_configured_remote_stopped

The **mkfcpartnership** or **mkippartnership** command is issued in both directions and the remote system is online and available. The **chpartnership** command with the **stop** parameter is issued from the remote system.

fully_configured_local_excluded

The **mkfcpartnership** or **mkippartnership** command is issued in both directions. The local system is excluding the connection to the remote system due to too many problems, or either system in the partnership is unable to sustain the I/O workload for the Metro Mirror, Global Mirror, or HyperSwap relationships.

fully_configured_remote_excluded

The **mkfcpartnership** or **mkippartnership** command has been issued in both directions. The remote system is excluding the connection to the local system due to too many problems, or either system in the partnership is unable to sustain the I/O workload for the Metro Mirror, Global Mirror, or HyperSwap relationships.

fully_configured_exceeded

Too many systems exist in the system network, and the partnership from the local system to the remote is disabled. Refer to the 1710 or 1720 errors in the system error log at the local and remote system.

bandwidth

The bandwidth available on the intersystem link for background copy, in megabytes per second (MBps).

Important: For partnerships over IP links with compression, this parameter specifies the aggregate bandwidth after the compression had been applied to the data. Do not set this parameter higher than the physical link bandwidth multiplied by the (carefully rounded down) compression factor.

The console_IP field displays either the:

- Automatically populated system port 1 IP Address - Internet Protocol Version 4 (IPv4) or IPv6
- User-populated IPv4 address

The port value is always 443, which requires the system to run by using default Hypertext Transfer Protocol Secure (HTTPS).

A concise invocation example

```
lssystem delim :
```

The resulting output:

```
id:name:location:partnership:id_alias  
000002006420A162:system0:local::000002006420A162
```

A detailed invocation example

```
lssystem -delim :
```

The resulting output:

```
id:00000200A2600906  
name:tbcluster-29  
location:local  
partnership  
bandwidth  
total_mdisk_capacity:60.5TB  
space_in_mdisk_grps:60.5TB  
space_allocated_to_vdisks:643.74GB  
total_free_space:59.9TB

Related reference

addnode (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

addiscsistorageport

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

cfgportip

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chscsiportauth

Use the **chscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

Syntax

➔ **lssystemcert** 

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If no data is displayed, headings are not displayed.

-delim delimiter

(Optional) By default, in a concise view all columns of data are space-separated, with the width of each column set to the maximum width of each item of data. In a detailed view, each item of data is an individual row, and if you display headers, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. Enter **-delim :** on the command line. The colon character (:) separates all items of data in a concise view. For example, the spacing of columns does not occur. In a detailed view, the specified *delimiter* separates the data from its header.

Description

This command lists information about the current system Secure Sockets Layer (SSL) certificate and indicates whether an outstanding certificate request exists.

Table 61 on page 705 provides attribute values that can be displayed as output view data.

Table 61. lssystemcert output	
Attribute	Possible Values
certificate	Indicates a readable version of the current SSL certificate.
certificate export	Indicates an encoded version of the SSL certificate.
certificate_request_outstanding	Indicates that an unfinished certificate request exists (if the value is yes) and installs a signed certificate. The value is yes or no.

An invocation example

```
lssystemcert
```

The detailed resulting output

```

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

Syntax

►► lssystemethernet 

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If no data is displayed, headings are not displayed.

-delim delimiter

(Optional) By default, in a concise view all columns of data are space-separated, with the width of each column set to the maximum width of each item of data. In a detailed view, each item of data is an individual row, and if you display headers, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. Enter **-delim :** on the command line. The colon character (:) separates all items of data in a concise view. For example, the spacing of columns does not occur. In a detailed view, the specified *delimiter* separates the data from its header.

Description

This command lists information about the current system Ethernet priority values for host attachment, system, and storage traffic.

This table provides attribute values that can be displayed as output view data.

Table 62. <i>lssystemethernet</i> output	
Attribute	Possible Values
host_attach_cos	Displays the system-wide host attachment priority tag that is used by all host attachment traffic over iSCSI, iSER, or NVMeF. The value is in the range 0 (default) - 7.
system_cos	Displays the system-wide clustering priority tag that is used by clustering traffic over iSER. The value is in the range 0 (default) - 7.
storage_cos	Displays the system-wide storage priority tag that is used by storage traffic. The value is in the range 0 (default) - 7.

An invocation example showing default priority values

```
lssystemethernet
```

The detailed resulting output

```
host_attach_cos  0
system_cos       0
storage_cos      0
```

An invocation example

```
lssystemethernet
```

The detailed resulting output

```
host_attach_cos  4
system_cos       5
storage_cos      6
```

addnode (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

addiscsistorageport

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

cfgportip

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chusra

Use the **chusra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsscsiportauth

Use the **lsscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsscsistorageport

Use the **lsscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsscsistorageportcandidate

Use the **lsscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

ls_timezone

Use the **ls_timezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **set_timezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

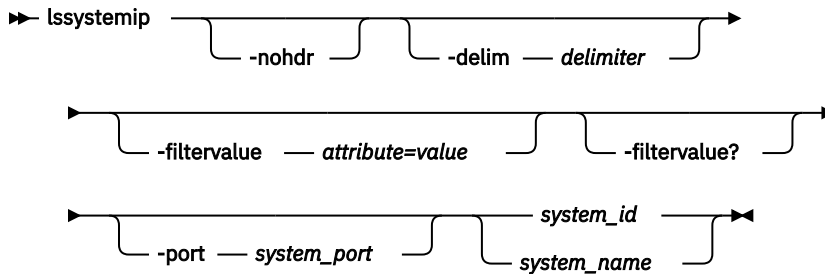

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each data item has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

-filtervalue attribute=value

(Optional) Specifies a list of one or more filters. Only objects with a value that matches the filter attribute value are displayed. If a capacity is specified, the units must also be included.

Note: Some filters allow the asterisk character (*) when you enter the command. The following rules apply to the use of wildcard characters when you use the command-line interface (CLI):

- The wildcard character is an asterisk (*).
- The command can contain a maximum of one wildcard.
- When you use a wildcard, you must enclose the filter entry within double quotation marks (" "), as shown in the following example:

```
lssystemip -filtervalue "system_name=md★"
```

-filtervalue?

(Optional) displays a list of filters that can be applied against this view. The following filter attributes are valid for the **lssystemip** command:

- port_id
- system_name
- system_id

system_id / system_name

(Required) Specifies the name or ID of a system.

-port system_port

(Required) Specifies the system port (1 or 2) to apply changes to.

Description

This command displays a list of the system management IP addresses configured for each port.

This table provides the attribute values that can be displayed as output view data.

Table 63. lssystemip output	
Attribute	Possible Values
cluster_id	Indicates the ID of the system.
cluster_name	Indicates the name of the system.
location	Indicates the system location.
port_id	Indicates the ID of the port.
IP_address	Indicates the Internet Protocol Version 4 (IPv4) address.
subnet_mask	Indicates the IPv4 subnet mask.
gateway	Indicates the IPv4 gateway.
IP_address_6	Indicates the Internet Protocol Version 6 (IPv6) address.
gateway_6	Indicates the IPv6 gateway.
prefix_6	Indicates the IPv6 prefix.

A concise invocation example

```
lssystemip -delim ,
```

The concise resulting output:

```
cluster_id,cluster_name,location,port_id,IP_address,subnet_mask,
gateway,IP_address_6,gateway_6,prefix_6
000002006CC0B71A,c11,local,1,192.168.1.2,DHCP,255.255.255.0,192.168.1.1,

Related reference

[addnode](#) (SAN Volume Controller only)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster](#) (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/**lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

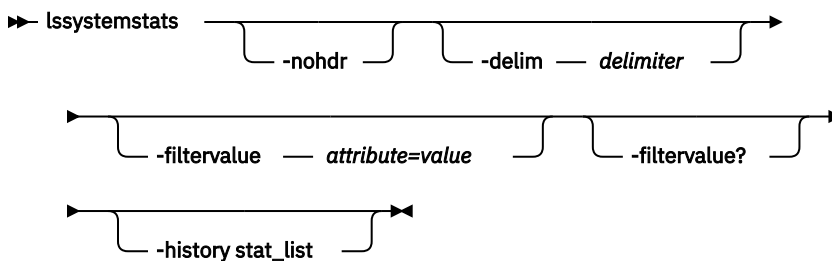

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

Syntax

Parameters

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If there is no data to be displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

-filtervalue attribute=value

(Optional) Specifies a list of one or more filters. Only objects with a value that matches the filter attribute value are displayed.

Note: Some filters allow the use of a wildcard when you enter the command. The following rules apply to the use of wildcards:

- The wildcard character is the asterisk (*).
- The command can contain a maximum of one wildcard.
- When you use a wildcard, enclose the filter entry within double quotation marks (""):

```
lssystemstats -filtervalue stat_name="io*"
```

-filtervalue?

(Optional) Displays the valid filter attributes for the **-filtervalue attribute=value** parameter:

- stat_name

-history stat_list

Provides the most recent node statistical values, specific node statistical values, or historical data for any node.

Description

This command returns one set of statistics for all the nodes in the system. The statistical values are determined by using samples that are received from each node.

Note: Values are rounded to the nearest integer when appropriate (for example, between one and ninety-nine for percentages).

This table provides the attribute values that can be displayed as output view data.

Table 64. <i>lssystemstats</i> attribute values	
Attribute	Value
stat_current	The current value of the statistic field.
stat_list	The system history of the reported statistics.
stat_name	The name of the statistic field.
stat_peak	The peak value of the statistic field in the last 5 minutes.
stat_peak_time	The time that the peak occurred.
sample_time	The time of the sample occurrence.
stat_value	The statistical value at the epoch interval.

Remember: Filtering is supported on the stat_name field by using the concise view.

This table provides the possible values that are applicable to the values that are displayed for the **stat_name** attribute.

Table 65. **Stat_name** field values

Value	Description
compression_cpu_pc	Displays the percentage of allocated CPU capacity that is used for compression.
cpu_pc	Displays the percentage of allocated CPU capacity that is used for the system.
fc_mb	Displays the total number of megabytes transferred per second (MBps) for Fibre Channel traffic on the system. This value includes host I/O and any bandwidth that is used for communication within the system.
fc_io	Displays the total input/output (I/O) operations that are transferred per seconds for Fibre Channel traffic on the system. This value includes host I/O and any bandwidth that is used for communication within the system.
sas_mb	Displays the total number of megabytes transferred per second (MBps) for serial-attached SCSI (SAS) traffic on the system. This value includes host I/O and bandwidth that is used for background RAID activity.
sas_io	Displays the total I/O operations that are transferred per second for SAS traffic on the system. This value includes host I/O and bandwidth that is used for background RAID activity.
iscsi_mb	Displays the total number of megabytes transferred per second (MBps) for iSCSI traffic on the system.
iscsi_io	Displays the total I/O operations that are transferred per second for iSCSI traffic on the system.
write_cache_pc	Displays the percentage of the write cache usage for the node.
total_cache_pc	Displays the total percentage for both the write and read cache usage for the node.
vdisk_mb	Displays the average number of megabytes transferred per second (MBps) for read and write operations to volumes during the sample period. Note: Only the write operation value is displayed.
vdisk_io	Displays the average number of I/O operations that are transferred per second for read and write operations to volumes during the sample period.
vdisk_ms	Displays the average amount of time in milliseconds that the system takes to respond to read and write requests to volumes over the sample period.
mdisk_mb	Displays the average number of megabytes transferred per second (MBps) for read and write operations to MDisks during the sample period.
mdisk_io	Displays the average number of I/O operations that are transferred per second for read and write operations to MDisks during the sample period.
mdisk_ms	Displays the average amount of time in milliseconds that the system takes to respond to read and write requests to MDisks over the sample period.
drive_mb	Displays the average number of megabytes transferred per second (MBps) for read and write operations to drives during the sample period.
drive_io	Displays the average number of I/O operations that are transferred per second for read and write operations to drives during the sample period.
drive_ms	Displays the average amount of time in milliseconds that the system takes to respond to read and write requests to drives over the sample period.

Table 65. **Stat_name** field values (continued)

Value	Description
vdisk_w_mb	Displays the average number of megabytes transferred per second (MBps) for read and write operations to volumes during the sample period.
vdisk_w_io	Displays the average number of I/O operations that are transferred per second for write operations to volumes during the sample period.
vdisk_w_ms	Displays the average amount of time in milliseconds that the system takes to respond to write requests to volumes over the sample period.
mdisk_w_mb	Displays the average number of megabytes transferred per second (MBps) for write operations to MDisks during the sample period.
mdisk_w_io	Displays the average number of I/O operations that are transferred per second for write operations to MDisks during the sample period.
mdisk_w_ms	Displays the average amount of time in milliseconds that the system takes to respond to write requests to MDisks over the sample period.
drive_w_mb	Displays the average number of megabytes transferred per second (MBps) for write operations to drives during the sample period.
drive_w_io	Displays the average number of I/O operations that are transferred per second for write operations to drives during the sample period.
drive_w_ms	Displays the average amount of time in milliseconds that the system takes to respond write requests to drives over the sample period.
vdisk_r_mb	Displays the average number of megabytes transferred per second (MBps) for read operations to volumes during the sample period.
vdisk_r_io	Displays the average number of I/O operations that are transferred per second for read operations to volumes during the sample period.
vdisk_r_ms	Displays the average amount of time in milliseconds that the system takes to respond to read requests to volumes over the sample period.
mdisk_r_mb	Displays the average number of megabytes transferred per second (MBps) for read operations to MDisks during the sample period.
mdisk_r_io	Displays the average number of I/O operations that are transferred per second for read operations to MDisks during the sample period.
mdisk_r_ms	Displays the average amount of time in milliseconds that the system takes to respond to read requests to MDisks over the sample period.
drive_r_mb	Displays the average number of megabytes transferred per second (MBps) for read operations to drives during the sample period
drive_r_io	Displays the average number of I/O operations that are transferred per second for read operations to drives during the sample period.
drive_r_ms	Displays the average amount of time in milliseconds that the system takes to respond to read requests to drives over the sample period.
iplink_mb	Displays the average number of megabytes requested to be transferred per second (MBps) over the IP partnership link during the sample period. This value is calculated before any compression of the data takes place. This value does not include iSCSI host input/output (I/O) operations.

Table 65. **Stat_name** field values (continued)

Value	Description
iplink_comp_mb	Displays the average number of compressed megabytes transferred per second (MBps) over the IP Replication link during the sample period. This value is calculated after any compression of the data takes place. This value does not include iSCSI host I/O operations. Note: If compression is disabled, the <code>iplink_mb</code> stats ID value is displayed instead.
cloud_up_mb	Displays the average number of megabytes transferred per second (Mbps) for upload operations to a cloud account during the sample period.
cloud_up_ms	Displays the average amount of time (in milliseconds) it takes for the system to respond to upload requests to a cloud account during the sample period.
cloud_down_mb	Displays the average number of Mbps for download operations to a cloud account during the sample period.
cloud_down_ms	Displays the average amount of time (in milliseconds) it takes for the system to respond to download requests to a cloud account during the sample period.
iser_io	Displays the total I/O operations that are transferred per second for iSER traffic on the system.
iser_mb	Displays the total number of megabytes transferred per second (MBps) for iSER traffic on the system.

A system summary invocation example

```
lssystemstats
```

The resulting output:

```
stat_name      stat_current  stat_peak  stat_peak_time
cpu_pc         5             6          111123104304
fc_mb          321           327        111123104129
fc_io          2167          2368       111123103904
sas_mb         438           534        111123104104
sas_io         5784          7738       111123104314
iscsi_mb       0             0          111123104359
iscsi_io       0             0          111123104359

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chscsistorageport

Use the **chscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chscsiportauth

Use the **chscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

lsclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsscsistorageportcandidate

Use the **lsscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/ **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister.

Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezone

Use the **lstimezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

Syntax

Parameters

-filtervalue attribute=value

(Optional) Specifies a list of one or more filters. Only objects with a value that matches the filter attribute value are returned. If a capacity is specified, the units must also be included.

Note: Some filters allow the use of a wildcard when you enter the command. The following rules apply to the use of wildcard characters when you use the CLI:

- The wildcard character is an asterisk (*), which must be the first or last character in the string.
- The command can contain a maximum of one wildcard.
- When you use a wildcard, enclose the filter entry within double quotation marks ("").

-nohdr

(Optional) By default, headings are displayed for each column of data in a concise style view, and for each item of data in a detailed style view. The **-nohdr** parameter suppresses the display of these headings.

Note: If no data is displayed, headings are not displayed.

-delim delimiter

(Optional) By default in a concise view, all columns of data are space-separated. The width of each column is set to the maximum width of each item of data. In a detailed view, each item of data has its own row, and if the headers are displayed, the data is separated from the header by a space. The **-delim** parameter overrides this behavior. Valid input for the **-delim** parameter is a 1-byte character. If you enter **-delim :** on the command line, the colon character (:) separates all items of data in a concise view; for example, the spacing of columns does not occur. In a detailed view, the data is separated from its header by the specified delimiter.

-filtervalue?

(Optional) Displays the valid filter attributes for the **lstargetportfc** command:

- port_id
- owning_node_id
- current_node_id
- host_io_permitted
- virtualized
- protocol

Description

This command generates lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning. This command also displays the current failover status of host I/O ports.

This table provides the attribute values that can be displayed as output view data.

Table 66. lstorageportfc output	
Attribute	Description
id	Indicates the ID of the port.
WWPN	Indicates the WWPN of the port. The value is hexadecimal.
WWNN	Indicates the worldwide node name (WWNN) of the port. The value is hexadecimal.
port_id	Indicates the system port ID. The value is the same as the lsportfc port_id field.
owning_node_id	Indicates the ID of the node that owns the port. Note: This node can be offline whether the port is online or offline.
current_node_id	Indicates the ID of the node on which this port is active. The value is blank if the port is not active on any node
nportid	Indicates the nportid hexadecimal value.
host_io_permitted	Indicates whether host I/O operations can run on the port. The values are yes and no.
virtualized	Indicates whether it is a virtualized port. The values are yes and no (which indicates that this port cannot be online on any node other than the owning node).
protocol	Indicates the protocol supported by the port. The values are scsi and nvme . Note: Some Fibre channel adapters and platforms do not support NVMe over Fibre Channel.

An invocation example

This example shows the concise output with the protocol field.

```
lstorageportfc
```

The detailed resulting output:

```

yes	yes	nvme				

An invocation example

This example shows the full output with the protocol field.

```
lstorageportfc 6
```

The detailed resulting output:

```
id 6
WWPN 500507680B2AC5C6
WWNN 500507680B00C5C6
port_id 2
owning_node_id 1
current_node_id 1
nportid 071501
host_io_permitted yes
virtualized yes
protocol nvme
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands.

All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.

Isclustercandidate (Discontinued)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

lscluster (Discontinued)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

lsclusterip (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezone

Use the **lstimezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

Syntax

➔ **mkquorumapp** 

Parameters

-ip_6

(Optional) Specifies that the quorum application uses IPv6 service addresses to connect to nodes. If this parameter is not specified, IPv4 is used to connect to nodes.

-nometadata

(Optional) This parameter is used if you do not require metadata that stores configuration data for node recovery operations with the IP quorum application.

Description

This command generates a Java application to use for quorum.

An invocation example

This example creates the file `/dumps/ip_quorum.jar` to use for IP quorum on an IPv4 network.

```
mkquorumapp
```

The detailed resulting output:

```
No feedback
```

An invocation example

This example creates the file `/dumps/ip_quorum.jar` to use for IP quorum on an IPv6 network.

```
mkquorumapp -ip_6
```

The detailed resulting output:

```
No feedback
```

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/ **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

ls_timezone

Use the **ls_timezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **set_timezone** command to set the time zone.

ls_sasportcandidate

Use the **ls_sasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

ls_security

Use the **ls_security** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

ls_site

Use the **ls_site** command to report the names of the sites.

ls_sra

Use the **ls_sra** command to check both secure remote assistance status and the time of the last login.

ls_throttle

Use the **ls_throttle** command to list throttle objects that are configured in the clustered system.

ls_system

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

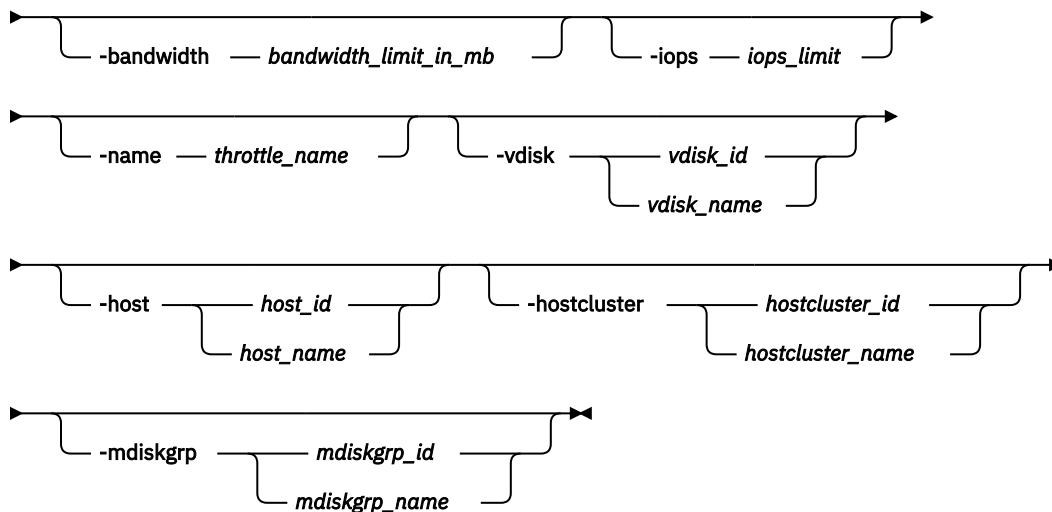

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

Syntax

➤ **mkthrottle** — **-type** — *offload / vdisk / host / hostcluster / mdiskgrp* ➔

Parameters

-type *offload / vdisk / host / hostcluster / mdiskgrp*

(Required) Specifies the type of throttle, either *offload* or *vdisk*.

-bandwidth *bandwidth_limit_in_mb*

(Optional) Specifies the bandwidth in MBps. This must be a numeric value 0 - 268435456.

-iops *iops_limit*

(Optional) Specifies the I/O operations limit. This must be a numeric value 0 - 33554432.

-name *throttle_name*

(Optional) Specifies the throttling object's name. This value must be an alphanumeric string up to 63 characters long.

-vdisk *vdisk_id / vdisk_name*

(Optional) Specifies the volume ID or name of the volume to throttle. The value must be a numeric or alphanumeric string.

Note: This keyword must be specified when you specify *-type vdisk*.

This parameter is mandatory for volume throttling but cannot be used for offload throttling.

-host *host_id* / *host_name*

(Optional) Specifies the host ID or name to throttle.

-hostcluster *hostcluster_id* / *hostcluster_name*

(Optional) Specifies the host cluster ID or name to throttle.

-mdiskgrp *mdiskgrp_id* / *mdiskgrp_name*

(Optional) Specifies the MDisk group (storage pool) or name to throttle. This applies to parent storage pools only.

Description

This command creates a new throttle object and associates it with an object (such as a volume).

Note:

- The throttle I/O limit is per node.
- A throttle object cannot be defined for a host if it is a part of host cluster that already has a host cluster throttle object defined for it.
- If a host cluster does not have a throttle object defined, its member hosts can have individual host throttles defined.
- [This command creates throttles on parent pools only, not child pools. Support for child pool throttles was removed in Version 8.3.1.](#)
- If a volume has multiple copies then throttling is done for the storage pool serving primary copy. Throttling is not applicable for secondary pools that are part of mirrored volumes or stretched cluster implementations.
-

An invocation example for creating a volume throttle of 10000 IOPs and a bandwidth limit of 500 MBps for volume `vdisk0`

```
mkthrottle -type vdisk -iops 10000 -bandwidth 500 -vdisk vdisk0
```

The detailed resulting output:

```
No feedback
```

An invocation example for creating offloaded I/O throttling with a bandwidth limit of 500 MBps

```
mkthrottle -type offload -bandwidth 500
```

The detailed resulting output:

```
No feedback
```

An invocation example for creating a host with a bandwidth limit of 100 MBps

```
mkthrottle -type host -bandwidth 100 -host host_Win2012SP2
```

The detailed resulting output:

```
No feedback
```

An invocation example for creating a host cluster with a bandwidth limit of 3000 MBps

```
mkthrottle -type hostcluster -bandwidth 3000 -hostcluster 0
```

The detailed resulting output:

```
No feedback
```

An invocation example for creating an MDisk group with a bandwidth limit of 4000 MBps

```
mkthrottle -type mdiskgrp -bandwidth 4000 -mdiskgrp 0
```

The detailed resulting output:

```
No feedback
```

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

[chbanner](#)

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

[chportib](#)

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

[chcluster \(Discontinued\)](#)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

[chiogrp](#)

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

[chiscsistorageport](#)

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

[chiscsiportauth](#)

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

[chnode](#)

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

[chnodebattery](#)

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

[chnodebootdrive](#)

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

[chnodehw \(SVC\) / chnodecanisterhw \(Storwize family products\)](#)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

[chquorum](#)

Use the **chquorum** command to change the quorum association.

[chsecurity](#)

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

[chsite](#)

Use the **chsite** command to change the site name.

[chsr](#)

Use the **chsr** command to configure support assistance.

[chsystem](#)

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

[chsystemcert](#)

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

[chsystemip](#)

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

[chsystemethernet](#)

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

[chthrottle](#)

Use the **chthrottle** command to change attributes associated with a specified throttle object.

[cleardumps](#)

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

[cpdumps](#)

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

[detectiscsistorageportcandidate](#)

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

[dumpconfig \(Discontinued\)](#)

Attention: The **dumpconfig** command is discontinued.

[help](#)

Use the **help** (or **man**) command to display help information for system commands.

[lsclustercandidate \(Discontinued\)](#)

Attention: The **lsclustercandidate** command has been discontinued. Use the **lspartnershipcandidate** command instead.

[lscluster \(Discontinued\)](#)

Attention: The **lscluster** command is discontinued. Use a combination of the **lspartnership**, **lspartnershipcandidate**, and **lssystem** commands instead.

[lsclusterip \(Discontinued\)](#)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

lsclusterstats (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

lsdiscoverystatus

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

lsfabric

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsiscsiportauth

Use the **lsiscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsiscsistorageport

Use the **lsiscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsiscsistorageportcandidate

Use the **lsiscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode**/ **lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezone

Use the **lstimezone** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

stopsystem

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

swapnode

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

ping

Use the **ping** command to diagnose IP configuration problems. The command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

Syntax

➔ ping — **-srcip4** — *source_ipv4_address destination_ipv4_address* — ➔
 — **-srcip6** — *source_ipv6_address destination_ipv6_address* —

Parameters

-srcip4 *source_ipv4_address destination_ipv4_address*

(Required if **-srcip6** is not specified) Specifies the IPv4 address that sends the ping packet. The IPv4 address must already be bound to a port on the node on which the command is issued. If you do not specify this parameter, you must specify **srcip6**.

-srcip6 *source_ipv6_address destination_ipv6_address*

(Required if **-srcip4** is not specified) Specifies the IPv6 address that sends the ping packet. The IPv6 address must already be bound to a port on the node on which the command is issued. If you do not specify this parameter, you must specify **srcip4**.

Description

This command checks whether the specified IP address is accessible from the node on which the command is run by using the specified IP address.

Use this command to ping from any port on any node when you are logged on to the service assistant on that node.

An invocation example

```
ping -srcip4 192.168.1.51 192.168.1.30
```

The resulting output

```
PING 192.168.1.51 (192.168.1.51)PING 9.20.136.11 (9.20.136.11) 56(84) bytes of data.  
64 bytes from 192.168.1.51: icmp_seq=1 ttl=249 time=0.690 ms

[lsclusterip](#) (Discontinued)

Attention: The **lsclusterip** command has been discontinued. Use the **lssystemip** command instead.

[lsclusterstats](#) (Discontinued)

Attention: The **lsclusterstats** command is discontinued. Use the **lssystemstats** command instead.

[lsdiscoverystatus](#)

Use the **lsdiscoverystatus** command to determine whether a discovery operation is in progress.

[lsfabric](#)

Use the **lsfabric** command to generate a report that displays the Fibre Channel (FC) connectivity between nodes, controllers, and hosts.

lsnvmefabric

Use the **lsnvmefabric** command to display information about NVMe logins from configured hosts.

lsfcportcandidate

Use the **lsfcportcandidate** command to list the Fibre Channel (FC) ports. This information is used to find open FC ports.

lsscsiportauth

Use the **lsscsiportauth** command to display the per initiator port authentication and authorization information that is configured. This command is for IBM Spectrum Virtualize for Public Cloud only.

lsscsistorageport

Use the **lsscsistorageport** command to display the details of the iSCSI login sessions that are established from the initiator's iSCSI source ports to the iSCSI backend target controller ports.

lsscsistorageportcandidate

Use the **lsscsistorageportcandidate** command to display a concise or detailed list of information about the candidate Internet Small Computer Systems Interface (iSCSI) target controller iSCSI Qualified Name (IQN) that is specified with the target IP from the specified initiator source ports.

lsiogrp

Use the **lsiogrp** command to display a concise list or a detailed view of input/output (I/O) groups visible to the system.

lshbaportcandidate (Deprecated)

The **lshbaportcandidate** command is deprecated. Use either the **lsfcportcandidate** or **lssasportcandidate** command instead.

lsiogrphost

Use the **lsiogrphost** command to display a list of the hosts mapped to a specified I/O group.

lsiogrpcandidate

Use the **lsiogrpcandidate** command to list the I/O groups that can have nodes added to them.

lsiostatsdumps (Deprecated)

Attention: The **lsiostatsdumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsiotracedumps (Deprecated)

Attention: The **lsiotracedumps** command is deprecated. Use the **lsdumps** command to display a list of files in a particular dumps directory.

lsnode (SVC) / lsnodecanister (Storwize family products)

Use the **lsnode/ lsnodecanister** command to return a concise list or a detailed view of nodes or node canisters that are part of the system .

lsnodebattery

Use the **lsnodebattery** command to display information about the batteries in a node.

lsnodebootdrive

Use the **lsnodebootdrive** command to return information about the internal boot drives for nodes. This command applies to SAN Volume Controller 2145-DH8 systems.

lsnodecandidate (SAN Volume Controller)

Use the **lsnodecandidate** command to list all of the nodes that are available to add to the clustered system.

lsnodecanisterstats

The **lsnodecanisterstats** command displays the most recent values of all node canister statistics, and displays all node canister statistics for a particular canister. This command also can be used to display a history of values for a subset of available statistics.

lsnodedependentvdisks (Deprecated)

Attention: The **lsnodedependentvdisks** command is deprecated. Use the **lsdependentvdisks** command instead.

lsnodehw (SVC) / lsnodecanisterhw (Storwize family products)

Use the **lsnodehw** / **lsnodecanisterhw** command to display the configured and actual hardware configuration of nodes in the clustered system.

lsnodepsu

Use the **lsnodepsu** command to display the power supply unit information of nodes in a system.

lsnodestats (SVC) / lsnodecanisterstats (Storwize family products)

Use the **lsnodestats** / **lsnodecanisterstats** command to display the most recent values of statistics for all nodes or node canisters, and display all statistics for a particular node or node canister. Additionally, You can use this command to display a history of values for a given subset of available statistics.

lsnodevpd (SVC) / lsnodecanistervpd (Storwize family products)

Use the **lsnodevpd** / **lsnodecanistervpd** command to display the vital product data (VPD) for each node.

lsportusb

Use the **lsportusb** command to display information about Universal Serial Bus (USB) ports.

lsportip

Use the **lsportip** command to list the configuration for each Ethernet port on each node in the system. This command shows the Internet Protocol (IP) address and whether the port is configured as an Internet Small Computer Systems Interface (iSCSI) port.

lsportfc

Use the **lsportfc** command to view the status and properties of the Fibre Channel (FC) input/output (I/O) ports for the clustered system.

lsportsas

Use the **lsportsas** command to display the status of all SAS ports in the clustered system.

lsquorum

Use the **lsquorum** command to list the quorum devices that the system uses to store quorum data.

lsroute

Use the **lsroute** command to display the IP routing table.

lstimezones

Use the **lstimezones** command to list the time zones that are available on the system. Each time zone is assigned an ID that can be used in the **settimezone** command to set the time zone.

lssasportcandidate

Use the **lssasportcandidate** command to list the unconfigured serial-attached SCSI (SAS) ports that are logged in and available to add to the SAS worldwide port name (WWPN) or host objects.

lssecurity

Use the **lssecurity** command to display the current system Secure Sockets Layer (SSL) or Transport Layer Security (TLS) security settings.

lssite

Use the **lssite** command to report the names of the sites.

lssra

Use the **lssra** command to check both secure remote assistance status and the time of the last login.

lsthrottle

Use the **lsthrottle** command to list throttle objects that are configured in the clustered system.

lssystem

Use the **lssystem** command to display a detailed view of a system.

lssystemcert

Use the **lssystemcert** command to list information about the current system Secure Sockets Layer (SSL) certificate.

lssystemethernet

Use the **lssystemethernet** command to list system-wide Ethernet priority tag details for host attachment, system, and storage traffic.

lssystemip

Use the **lssystemip** command to display a list of the system management IP addresses configured for each port.

lssystemstats

Use the **lssystemstats** command to display the most recent values of all node statistics in a system, or to display a history of values for a specified subset of available statistics across all nodes in a system. This command also can be used to display a history of values for a specified subset of available statistics.

lstargetportfc

Use the **lstargetportfc** command to generate the lists of worldwide port names (WWPNs) required to set up Fibre Channel (FC) zoning and to display the current failover status of host I/O ports.

mkquorumapp

Use the **mkquorumapp** command to generate a Java application to use for quorum.

mkthrottle

Use the **mkthrottle** command to create a new throttle object and associate it with an object (such as a volume). You can also create offloaded I/O throttling (which is a single clustered system throttle).

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

rmnode (SVC) / rmnodecanister (Storwize family products)

The **rmnode** / **rmnodecanister** command deletes a node from the clustered system. You can enter this command any time after a clustered system has been created.

rmportip

Use the **rmportip** command to remove an internet Small Computer System Interface (iSCSI) Internet Protocol (IP) address from a node Ethernet port.

rmthrottle

Use the **rmthrottle** command to remove the throttle object associated with any volume.

setclustertime (Discontinued)

Attention: The **setclustertime** command has been discontinued. Use the **setsystemtime** command instead.

setsystemtime

Use the **setsystemtime** command to set the time for the system.

setpwdreset

Use the **setpwdreset** command to view and change the status of the password-reset feature for the node.

settimezone

Use the **settimezone** command to set the time zone for the system.

showtimezone

Use the **showtimezone** command to display the current time zone settings for the cluster.

startstats

Use the **startstats** command to modify the interval at which per-node statistics for volumes, managed disks (MDisks), and nodes are collected.

stopstats (Deprecated)

The **stopstats** command is deprecated. You can no longer disable statistics collection.

stopcluster (Discontinued)

Attention: The **stopcluster** command is discontinued. Use the **stopsystem** command instead.

[stopsystem](#)

Use the **stopsystem** command to shut down a single node or the entire system in a controlled manner. When you issue this command, you are prompted with a confirmation of intent to process the command.

[swapnode](#)

Use the **swapnode** command to exchange and maintain nodes without interruption to the virtualized target ports associated with the specified node.

rmiscsistorageport

Use the **rmiscsistorageport** command to remove established Internet Small Computer Systems Interface (iSCSI) sessions between system nodes and backend iSCSI target.

Syntax

➤ **rmiscsistorageport** — *lsiscsistorageport_row_id* ➤

Parameters

lsiscsistorageport_row_id

(Required) Specifies the row ID of the selected row in the output of **lsiscsistorageport** command.

Description

Use this command to remove path groups that are established after you specify **addiscsistorageport** (not individual paths).

Any dependencies must be removed before you specify this command. The ID of the session that is listed (after you specify **lsiscsistorageport**) is used to identify the sessions that must be removed.

A detailed invocation example

First, specify **addiscsistorageport** for discovery and **lsiscsistorageport** to show any added session. Then, specify **rmiscsistorageport** to remove sessions that are indicated by view ID 0. No *tgt_user_name* or *target_chap* is required for discovery or session establishment.

```
rmiscsistorageport 0
```

The following detailed output is displayed:

```
No feedback
```

Related reference

[addnode \(SAN Volume Controller only\)](#)

Use the **addnode** command to add a new (candidate) node to an existing system. Enter this command any time after a system is created. If you are adding a node to a system, make sure that the model type of the new node is supported by the system code (code) version of the existing system. If the model type is not supported by the code, upgrade the system to a code version that supports the model type of the new node.

[addiscsistorageport](#)

Use the **addiscsistorageport** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any (or all) nodes in a specified I/O group (or the entire clustered system) to a discovered backend target iSCSI controller.

[cfgportip](#)

Use the **cfgportip** command to assign an Internet Protocol (IP) address to each node Ethernet port for Internet Small Computer System Interface (iSCSI) input/output (I/O).

chbanner

Use the **chbanner** command to configure the login message that is displayed during CLI Secure Shell (SSH) login.

chportib

Use the **chportib** command to assign an Internet Protocol (IP) address to each node Ethernet port for NVMe for InfiniBand ports.

chcluster (Discontinued)

Attention: The **chcluster** command has been discontinued. Use the **chsystem** command instead.

chiogrp

Use the **chiogrp** command to modify the name of an I/O group, or the amount of memory that is available for RAID arrays, Copy Services, FlashCopy services, or volume mirroring operations.

chiscsistorageport

Use the **chiscsistorageport** command to change authentication parameters, such as setting authentication credentials, removing authentication parameters, or updating credentials.

chiscsiportauth

Use the **chiscsiportauth** command to set or configure the iSCSI Initiator authentication or authorization information that is used to connect to the backend IBM Cloud storage. This command is for IBM Spectrum Virtualize for Public Cloud only.

chnode

Use the **chnode** / **chnodecanister** command to change the name that is assigned to a node or node canister as well as other options. You can then use the new name when running subsequent commands. All parameters that are associated with this command are optional. However, you must specify one or more parameters.

chnodebattery

Use the **chnodebattery** command to set or clear the light-emitting diode (LED) on a hot-swappable battery (in a node).

chnodebootdrive

Use the **chnodebootdrive** command to change a drive or synchronize the drives on a system if a drive or field-replaceable unit (FRU) replacement drive breaks.

chnodehw (SVC) / chnodecanisterhw (Storwize family products)

Use the **chnodehw** / **chnodecanisterhw** command to update the hardware configuration for a node or node canister.

chquorum

Use the **chquorum** command to change the quorum association.

chsecurity

Use the **chsecurity** command to change the Secure Sockets Layer (SSL), Secure Shell (SSH), or Transport Layer Security (TLS) security settings for a system.

chsite

Use the **chsite** command to change the site name.

chsra

Use the **chsra** command to configure support assistance.

chsystem

Use the **chsystem** command to modify the attributes of an existing system. Enter this command any time after a system is created. All the parameters that are associated with this command are optional. However, you must specify one or more parameters with this command.

chsystemcert

Use the **chsystemcert** command to manage the Secure Sockets Layer (SSL) certificate that is installed on a system.

chsystemip

Use the **chsystemip** command to modify the Internet Protocol (IP) configuration parameters for the system.

chsystemethernet

The **chsystemethernet** command is used to set the priority tag for host attachment, system, and storage traffic.

chthrottle

Use the **chthrottle** command to change attributes associated with a specified throttle object.

cleardumps

Use the **cleardumps** command to clear (or delete) the various dump directories on a specified node or node canister.

cpdumps

Use the **cpdumps** command to copy dump files from a nonconfiguration node onto the configuration node.

detectiscsistorageportcandidate

Use the **detectiscsistorageportcandidate** command to establish Internet Small Computer Systems Interface (iSCSI) login sessions from any nodes in a specified I/O group to a discovered backend iSCSI target controller.

dumpconfig (Discontinued)

Attention: The **dumpconfig** command is discontinued.

help

Use the **help** (or **man**) command to display help information for system commands.
